T_IM signal can be used to select between MIPI interface (normal mode) or serial interface (test mode).

T_IM	Interface mode
0	MIPI Interface
1	DPI/DBI type-C Option 1 (9-bit SPI)

The serial interface is used to communicate between the MPU and the LCD driver chip. It uses CSX (chip select), DCX (data/command select), SCL (serial clock), SDA (serial data input/output). Serial clock (SCL) can be stopped when no communication is necessary. CSX, DCX, SCL and SDA signals should be No Connect when test mode is disabled.
