

# PIC24H Family Data Sheet

High-Performance, 16-bit Microcontrollers

#### Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not
  mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY FITNESS FOR PURPOSE. Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights.

### **Trademarks**

The Microchip name and logo, the Microchip logo, Accuron, dsPIC, KEELOQ, microID, MPLAB, PIC, PICmicro, PICSTART, PRO MATE, PowerSmart, rfPIC and SmartShunt are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AmpLab, FilterLab, Migratable Memory, MXDEV, MXLAB, SEEVAL, SmartSensor and The Embedded Control Solutions Company are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Analog-for-the-Digital Age, Application Maestro, CodeGuard, dsPICDEM, dsPICDEM.net, dsPICworks, ECAN, ECONOMONITOR, FanSense, FlexROM, fuzzyLAB, In-Circuit Serial Programming, ICSP, ICEPIC, Linear Active Thermistor, Mindi, MiWi, MPASM, MPLIB, MPLINK, PICkit, PICDEM, PICDEM.net, PICLAB, PICtail, PowerCal, PowerInfo, PowerMate, PowerTool, REAL ICE, rfLAB, rfPICDEM, Select Mode, Smart Serial, SmartTel, Total Endurance, UNI/O, WiperLock and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

 $\ensuremath{\mathsf{SQTP}}$  is a service mark of Microchip Technology Incorporated in the U.S.A.

All other trademarks mentioned herein are property of their respective companies.

QUALITY MANAGEMENT SYSTEM

CERTIFIED BY DNV

ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona, Gresham, Oregon and Mountain View, California. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

# PIC24H

# **High-Performance, 16-bit Microcontrollers**

# **Operating Range:**

- DC 40 MIPS (40 MIPS @ 3.0-3.6V, -40°C to +85°C)
- Industrial temperature range (-40°C to +85°C)

# **High-Performance DSC CPU:**

- · Modified Harvard architecture
- · C compiler optimized instruction set
- 16-bit wide data path
- · 24-bit wide instructions
- Linear program memory addressing up to 4M instruction words
- · Linear data memory addressing up to 64 Kbytes
- 71 base instructions: mostly 1 word/1 cycle
- Sixteen 16-bit General Purpose Registers
- Flexible and powerful Indirect Addressing modes
- Software stack
- 16 x 16 multiply operations
- 32/16 and 16/16 divide operations
- Up to ±16-bit data shifts

### **Direct Memory Access (DMA):**

- 8-channel hardware DMA
- 2 Kbytes dual ported DMA buffer area (DMA RAM) to store data transferred via DMA:
  - Allows data transfer between RAM and a peripheral while CPU is executing code (no cycle stealing)
- · Most peripherals support DMA

### **Interrupt Controller:**

- 5-cycle latency
- 118 interrupt vectors
- Up to 61 available interrupt sources
- · Up to 5 external interrupts
- 7 programmable priority levels
- · 5 processor exceptions

# Digital I/O:

- Up to 85 programmable digital I/O pins
- Wake-up/Interrupt-on-Change on up to 24 pins
- · Output pins can drive from 3.0V to 3.6V
- · All digital input pins are 5V tolerant

· 4 mA sink on all I/O pins

### **On-Chip Flash and SRAM:**

- Flash program memory, up to 256 Kbytes
- Data SRAM, up to 16 Kbytes (includes 2 Kbytes of DMA RAM)

### **System Management:**

- · Flexible clock options:
  - External, crystal, resonator, internal RC
  - Fully integrated PLL
  - Extremely low jitter PLL
- · Power-up Timer
- · Oscillator Start-up Timer/Stabilizer
- · Watchdog Timer with its own RC oscillator
- · Fail-Safe Clock Monitor
- · Reset by multiple sources

### **Power Management:**

- On-chip 2.5V voltage regulator
- · Switch between clock sources in real time
- · Idle, Sleep and Doze modes with fast wake-up

### Timers/Capture/Compare/PWM:

- Timer/Counters, up to nine 16-bit timers:
  - Can pair up to make four 32-bit timers
  - 1 timer runs as Real-Time Clock with external 32.768 kHz oscillator
  - Programmable prescaler
- Input Capture (up to 8 channels):
  - Capture on up, down or both edges
  - 16-bit capture input functions
  - 4-deep FIFO on each capture
- Output Compare (up to 8 channels):
  - Single or Dual 16-Bit Compare mode
  - 16-bit Glitchless PWM mode

### Communication Modules:

- 3-wire SPI (up to 2 modules):
  - Framing supports I/O interface to simple codecs
  - Supports 8-bit and 16-bit data
  - Supports all serial clock formats and sampling modes
- I<sup>2</sup>C<sup>™</sup> (up to 2 modules):
  - Full Multi-Master Slave mode support
  - 7-bit and 10-bit addressing
  - Bus collision detection and arbitration
  - Integrated signal conditioning
  - Slave address masking
- UART (up to 2 modules):
  - Interrupt on address bit detect
  - Interrupt on UART error
  - Wake-up on Start bit from Sleep mode
  - 4-character TX and RX FIFO buffers
  - LIN bus support
  - IrDA® encoding and decoding in hardware
  - High-Speed Baud mode
  - Hardware Flow Control with CTS and RTS
- Enhanced CAN (ECAN<sup>™</sup> module) 2.0B active (up to 2 modules):
  - Up to 8 transmit and up to 32 receive buffers
  - 16 receive filters and 3 masks
  - Loopback, Listen Only and Listen All Messages modes for diagnostics and bus monitoring
  - Wake-up on CAN message
  - Automatic processing of Remote Transmission Requests
  - FIFO mode using DMA
  - DeviceNet™ addressing support

### **Analog-to-Digital Converters:**

- Up to two A/D modules in a device
- 10-bit, 1.1 Msps or 12-bit, 500 ksps conversion:
  - 2, 4 or 8 simultaneous samples
  - Up to 32 input channels with auto-scanning
  - Conversion start can be manual or synchronized with 1 of 4 trigger sources
  - Conversion possible in Sleep mode
  - ±2 LSb max integral nonlinearity
  - ±1 LSb max differential nonlinearity

### **CMOS Flash Technology:**

- Low-power, high-speed Flash technology
- · Fully static design
- 3.3V (±10%) operating voltage
- · Industrial temperature
- · Low-power consumption

### Packaging:

- 100-pin TQFP (14x14x1 mm and 12x12x1 mm)
- 64-pin TQFP (10x10x1 mm)

**Note:** See the device variant tables for exact peripheral features per device.

# **PIC24H PRODUCT FAMILIES**

The PIC24H General Purpose Family is ideal for a wide variety of 16-bit MCU embedded applications. The device names, pin counts, memory sizes and peripheral availability of each family are listed below, followed by their pinout diagrams.

# **PIC24H General Purpose Family Variants**

| Device          | Pins | Program<br>Flash<br>Memory (KB) | RAM <sup>(1)</sup> (KB) | DMA Channels | Timer 16-bit | Input Capture | Output Compare<br>Std. PWM | Codec<br>Interface | ADC             | UART | SPI | I <sup>2</sup> Стм | CAN | I/O Pins (Max) <sup>(2)</sup> | Packages |

# TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com** or fax the **Reader Response Form** in the back of this data sheet to (480) 792-4150. We welcome your feedback.

### **Most Current Data Sheet**

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000A is version A of document DS30000).

### **Errata**

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; http://www.microchip.com
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include literature number) you are using.

### **Customer Notification System**

Register on our web site at www.microchip.com to receive the most current information on all of our products.

### 1.0 DEVICE OVERVIEW

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

This document contains device specific information for the following devices:

- PIC24HJ64GP206
- PIC24HJ64GP210
- PIC24HJ64GP506
- PIC24HJ64GP510
- PIC24HJ128GP206
- PIC24HJ128GP210
- PIC24HJ128GP506
- PIC24HJ128GP510
- PIC24HJ128GP306
- PIC24HJ128GP310
- PIC24HJ256GP206
- PIC24HJ256GP210
- 1 10241 1025001 210
- PIC24HJ256GP610

The PIC24H device family includes devices with different pin counts (64 and 100 pins), different program memory sizes (64 Kbytes, 128 Kbytes and 256 Kbytes) and different RAM sizes (8 Kbytes and 16 Kbytes).

This makes these families suitable for a wide variety of high-performance digital signal control applications. The devices are pin compatible with the dsPIC33F family of devices, and also share a very high degree of compatibility with the dsPIC30F family devices. This allows easy migration between device families as may be necessitated by the specific functionality, computational resource and system cost requirements of the application.

The PIC24H device family employs a powerful 16-bit architecture, ideal for applications that rely on high-speed, repetitive computations, as well as control.

The 17 x 17 multiplier, hardware support for division operations, multi-bit data shifter, a large array of 16-bit working registers and a wide variety of data addressing modes, together provide the PIC24H Central Processing Unit (CPU) with extensive mathematical processing capability. Flexible and deterministic interrupt handling, coupled with a powerful array of peripherals, renders the PIC24H devices suitable for

control applications. Further, Direct Memory Access (DMA) enables overhead-free transfer of data between several peripherals and a dedicated DMA RAM. Reliable, field programmable Flash program memory ensures scalability of applications that use PIC24H devices.

Figure 1-1 shows a general block diagram of the various core and peripheral modules in the PIC24H family of devices, while Table 1-1 lists the functions of the various pins shown in the pinout diagrams.

PIC24H GENERAL BLOCK DIAGRAM

TABLE 1-1: PINOUT I/O DESCRIPTIONS

| Pin Name   | Pin<br>Type                     | Buffer<br>Type                   | Description   |
|--|---------------------------------|----------------------------------|---|
| AN0-AN31   | I                               | Analog                           | Analog input channels.  |
| AVDD   | Р                               | Р                                | Positive supply for analog modules.   |
| AVss   | Р                               | Р                                | Ground reference for analog modules.  |

### 2.0 CPU

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The PIC24H CPU module has a 16-bit (data) modified Harvard architecture with an enhanced instruction set and addressing modes. The CPU has a 24-bit instruction word with a variable length opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. The actual amount of program memory implemented varies by device. A single-cycle instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. All instructions execute in a single cycle, with the exception of instructions that change the program flow, the double word move (MOV.D) instruction and the table instructions. Overhead-free, single-cycle program loop constructs are supported using the REPEAT instruction, which is interruptible at any point.

The PIC24H devices have sixteen, 16-bit working registers in the programmer's model. Each of the working registers can serve as a data, address or address offset register. The 16th working register (W15) operates as a software Stack Pointer (SP) for interrupts and calls.

The PIC24H instruction set includes many addressing modes and is designed for optimum C compiler efficiency. For most instructions, the PIC24H is capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, three parameter instructions can be supported, allowing A + B = C operations to be executed in a single cycle.

A block diagram of the CPU is shown in Figure 2-1, and the programmer's model for the PIC24H is shown in Figure 2-2.

### 2.1 Data Addressing Overview

The data space can be linearly addressed as 32K words or 64 Kbytes using an Address Generation Unit (AGU). The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary defined by the 8-bit Program Space Visibility Page (PSVPAG) register. The program to data space mapping feature lets any instruction access program space as if it were data space.

The data space also includes 2 Kbytes of DMA RAM, which is primarily used for DMA data transfers, but may be used as general purpose RAM.

### 2.2 Special MCU Features

The PIC24H features a 17-bit by 17-bit, single-cycle multiplier. The multiplier can perform signed, unsigned and mixed-sign multiplication. Using a 17-bit by 17-bit multiplier for 16-bit by 16-bit multiplication makes mixed-sign multiplication possible.

The PIC24H supports 16/16 and 32/16 integer divide operations. All divide instructions are iterative operations. They must be executed within a REPEAT loop, resulting in a total execution time of 19 instruction cycles. The divide operation can be interrupted during any of those 19 cycles without loss of data.

A multi-bit data shifter is used to perform up to a 16-bit, left or right shift in a single cycle.

FIGURE 2-1: PIC24H CPU CORE BLOCK DIAGRAM

### 2.3 CPU Control Registers

# REGISTER 2-1: SR: CPU STATUS REGISTER

| U-0    | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | R/W-0 |
|--------|-----|-----|-----|-----|-----|-----|-------|
| _      | _   | _   | _   | _   | _   | _   | DC    |
| bit 15 |     |     |     |     | _   |     | bit 8 |

| R/W-0 <sup>(1)</sup> | R/W-0 <sup>(2)</sup>    | R/W-0 <sup>(2)</sup> | R-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|----------------------|-------------------------|----------------------|-----|-------|-------|-------|-------|
|                      | IPL<2:0> <sup>(2)</sup> |                      | RA  | N     | OV    | Z     | С     |
| bit 7                |                         |                      |     |       |       |       | bit 0 |

Legend:

C = Clear only bit R = Readable bit U = Unimplemented bit, read as '0'

S = Set only bit W = Writable bit -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15-9 **Unimplemented:** Read as '0' bit 8 **DC:** MCU ALU Half Carry/Borrow bit

1 = A carry-out from the 4th low-order bit (for byte sized data) or 8th low-order bit (for word sized data) of the result occurred

0 = No carry-out from the 4th low-order bit (for byte sized data) or 8th low-order bit (for word sized data) of the result occurred

bit 7-5 IPL<2:0>: CPU Interrupt Priority Level Status bits<sup>(2)</sup>

111 = CPU Interrupt Priority Level is 7 (15), user interrupts disabled

110 = CPU Interrupt Priority Level is 6 (14) 101 = CPU Interrupt Priority Level is 5 (13) 100 = CPU Interrupt Priority Level is 4 (12) 011 = CPU Interrupt Priority Level is 3 (11)

010 = CPU Interrupt Priority Level is 2 (10) 001 = CPU Interrupt Priority Level is 1 (9)

000 = CPU Interrupt Priority Level is 0 (8)

bit 4 RA: REPEAT Loop Active bit

1 = REPEAT loop in progress 0 = REPEAT loop not in progress

bit 3 N: MCU ALU Negative bit

1 = Result was negative

0 = Result was non-negative (zero or positive)

bit 2 **OV:** MCU ALU Overflow bit

This bit is used for signed arithmetic (2's complement). It indicates an overflow of the magnitude which causes the sign bit to change state.

1 = Overflow occurred for signed arithmetic (in this arithmetic operation)

0 = No overflow occurred

bit 1 Z: MCU ALU Zero bit

1 = An operation which affects the Z bit has set it at some time in the past

0 = The most recent operation which affects the Z bit has cleared it (i.e., a non-zero result)

Note 1: The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.

2: The IPL<2:0> Status bits are read only when NSTDIS = 1 (INTCON1<15>).

# REGISTER 2-1: SR: CPU STATUS REGISTER (CONTINUED)

bit 0 C: MCU ALU Carry/Borrow bit

 ${\tt 1}$  = A carry-out from the Most Significant bit (MSb) of the result occurred

0 = No carry-out from the Most Significant bit of the result occurred

**Note 1:** The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.

2: The IPL<2:0> Status bits are read only when NSTDIS = 1 (INTCON1<15>).

### REGISTER 2-2: CORCON: CORE CONTROL REGISTER

| 0' = Bit is cleared | 'x = Bit is unknown | U = Unimplemented bit. | read as '0'      |

bit 15-4 Unimplemented: Read as '0'

bit 3 IPL3: CPU Interrupt Priority Level Status bit 3<sup>(1)</sup>

1 = CPU interrupt priority level is greater than 70 = CPU interrupt priority level is 7 or less

bit 2 PSV: Program Space Visibility in Data Space Enable bit

1 = Program space visible in data space0 = Program space not visible in data space

bit 1-0 **Unimplemented:** Read as '0'

Note 1: The IPL3 bit is concatenated with the IPL<2:0> bits (SR<7:5>) to form the CPU interrupt priority level.

### 2.4 Arithmetic Logic Unit (ALU)

The PIC24H ALU is 16 bits wide and is capable of addition, subtraction, bit shifts and logic operations. Unless otherwise mentioned, arithmetic operations are 2's complement in nature. Depending on the operation, the ALU may affect the values of the Carry (C), Zero (Z), Negative (N), Overflow (OV) and Digit Carry (DC) Status bits in the SR register. The C and DC Status bits operate as Borrow and Digit Borrow bits, respectively, for subtraction operations.

The ALU can perform 8-bit or 16-bit operations, depending on the mode of the instruction that is used. Data for the ALU operation can come from the W register array, or data memory, depending on the addressing mode of the instruction. Likewise, output data from the ALU can be written to the W register array or a data memory location.

Refer to the "dsPIC30F/33F Programmer's Reference Manual" (DS70157) for information on the SR bits affected by each instruction.

The PIC24H CPU incorporates hardware support for both multiplication and division. This includes a dedicated hardware multiplier and support hardware for 16-bit divisor division.

### 2.4.1 MULTIPLIER

Using the high-speed 17-bit x 17-bit multiplier, the ALU supports unsigned, signed or mixed-sign operation in several multiplication modes:

- 1. 16-bit x 16-bit signed
- 2. 16-bit x 16-bit unsigned
- 3. 16-bit signed x 5-bit (literal) unsigned
- 4. 16-bit unsigned x 16-bit unsigned
- 5. 16-bit unsigned x 5-bit (literal) unsigned
- 6. 16-bit unsigned x 16-bit signed
- 7. 8-bit unsigned x 8-bit unsigned

### 2.4.2 DIVIDER

The divide block supports 32-bit/16-bit and 16-bit/16-bit signed and unsigned integer divide operations with the following data sizes:

- 1. 32-bit signed/16-bit signed divide
- 2. 32-bit unsigned/16-bit unsigned divide
- 3. 16-bit signed/16-bit signed divide
- 4. 16-bit unsigned/16-bit unsigned divide

The quotient for all divide instructions ends up in W0 and the remainder in W1. Sixteen-bit signed and unsigned DIV instructions can specify any W register for both the 16-bit divisor (Wn) and any W register (aligned) pair (W(m + 1):Wm) for the 32-bit dividend. The divide algorithm takes one cycle per bit of divisor, so both 32-bit/16-bit and 16-bit/16-bit instructions take the same number of cycles to execute.

### 2.4.3 MULTI-BIT DATA SHIFTER

The multi-bit data shifter is capable of performing up to 16-bit arithmetic or logic right shifts, or up to 16-bit left shifts in a single cycle. The source can be either a working register or a memory location.

The shifter requires a signed binary value to determine both the magnitude (number of bits) and direction of the shift operation. A positive value shifts the operand right. A negative value shifts the operand left. A value of '0' does not modify the operand.

NOTES:

### 3.0 MEMORY ORGANIZATION

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The PIC24H architecture features separate program and data memory spaces and buses. This architecture also allows the direct access of program memory from the data space during code execution.

### 3.1 Program Address Space

The program address memory space of the PIC24H devices is 4M instructions. The space is addressable by a 24-bit value derived from either the 23-bit Program Counter (PC) during program execution, or from table operation or data space remapping as described in **Section 3.4** "Interfacing Program and Data Memory Spaces".

User access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

Memory maps for the PIC24H family of devices are shown in Figure 3-1.

FIGURE 3-1: PROGRAM MEMORY MAP FOR PIC24H FAMILY DEVICES

# 3.1.1 PROGRAM MEMORY ORGANIZATION

The program memory space is organized in word-addressable blocks. Although it is treated as 24 bits wide, it is more appropriate to think of each address of the program memory as a lower and upper word, with the upper byte of the upper word being unimplemented. The lower word always has an even address, while the upper word has an odd address (Figure 3-2).

Program memory addresses are always word-aligned on the lower word, and addresses are incremented or decremented by two during code execution. This arrangement also provides compatibility with data memory space addressing and makes it possible to access data in the program memory space.

### 3.1.2 INTERRUPT AND TRAP VECTORS

All PIC24H devices reserve the addresses between 0x00000 and 0x000200 for hard-coded program execution vectors. A hardware Reset vector is provided to redirect code execution from the default value of the PC on device Reset to the actual start of code. A GOTO instruction is programmed by the user at 0x0000000, with the actual address for the start of code at 0x0000002.

PIC24H devices also have two interrupt vector tables, located from 0x000004 to 0x0000FF and 0x000100 to 0x0001FF. These vector tables allow each of the many device interrupt sources to be handled by separate Interrupt Service Routines (ISRs). A more detailed discussion of the interrupt vector tables is provided in **Section 6.1 "Interrupt Vector Table"**.

FIGURE 3-2: PROGRAM MEMORY ORGANIZATION

### 3.2 Data Address Space

The PIC24H CPU has a separate 16-bit wide data memory space. The data space is accessed using separate Address Generation Units (AGUs) for read and write operations. Data memory maps of devices with different RAM sizes are shown in Figure 3-3 and Figure 3-4.

All Effective Addresses (EAs) in the data memory space are 16 bits wide and point to bytes within the data space. This arrangement gives a data space address range of 64 Kbytes or 32K words. The lower half of the data memory space (that is, when EA<15> = 0) is used for implemented memory addresses, while the upper half (EA<15> = 1) is reserved for the Program Space Visibility area (see Section 3.4.3 "Reading Data From Program Memory Using Program Space Visibility").

PIC24H devices implement up to 16 Kbytes of data memory. Should an EA point to a location outside of this area, an all-zero word or byte will be returned.

#### 3.2.1 DATA SPACE WIDTH

The data memory space is organized in byte addressable, 16-bit wide blocks. Data is aligned in data memory and registers as 16-bit words, but all data space EAs resolve to bytes. The Least Significant Bytes of each word have even addresses, while the Most Significant Bytes have odd addresses.

# 3.2.2 DATA MEMORY ORGANIZATION AND ALIGNMENT

To maintain backward compatibility with PICmicro® MCU devices and improve data space memory usage efficiency, the PIC24H instruction set supports both word and byte operations. As a consequence of byte accessibility, all effective address calculations are internally scaled to step through word-aligned memory. For example, the core recognizes that Post-Modified Register Indirect Addressing mode [Ws++] will result in a value of Ws + 1 for byte operations and Ws + 2 for word operations.

Data byte reads will read the complete word that contains the byte, using the Least Significant bit (LSb) of any EA to determine which byte to select. The selected byte is placed onto the Least Significant Byte (LSB) of the data path. That is, data memory and registers are organized as two parallel byte-wide entities with shared (word) address decode but separate write lines. Data byte writes only write to the corresponding side of the array or register which matches the byte address.

All word accesses must be aligned to an even address. Misaligned word data fetches are not supported, so care must be taken when mixing byte and word operations, or translating from 8-bit MCU code. If a misaligned read or write is attempted, an address error trap is generated. If the error occurred on a read, the instruction underway is completed; if it occurred on a write, the instruction will be executed but the write does not occur. In either case, a trap is then executed, allowing the system and/or user to examine the machine state prior to execution of the address Fault.

All byte loads into any W register are loaded into the Least Significant Byte. The Most Significant Byte (MSB) is not modified.

A sign-extend instruction (SE) is provided to allow users to translate 8-bit signed data to 16-bit signed values. Alternatively, for 16-bit unsigned data, users can clear the Most Significant Byte of any W register by executing a zero-extend (ZE) instruction on the appropriate address.

### 3.2.3 SFR SPACE

The first 2 Kbytes of the Near Data Space, from 0x0000 to 0x07FF, is primarily occupied by Special Function Registers (SFRs). These are used by the PIC24H core and peripheral modules for controlling the operation of the device.

SFRs are distributed among the modules that they control, and are generally grouped together by module. Much of the SFR space contains unused addresses; these are read as '0'. A complete listing of implemented SFRs, including their addresses, is shown in Table 3-1 through Table 3-31.

Note: The actual set of peripheral features and interrupts varies by the device. Please refer to the corresponding device tables and pinout diagrams for device-specific information.

### 3.2.4 NEAR DATA SPACE

The 8-Kbyte area between 0x0000 and 0x1FFF is referred to as the Near Data Space. Locations in this space are directly addressable via a 13-bit absolute address field within all memory direct instructions. Additionally, the whole data space is addressable using MoV instructions, which support Memory Direct Addressing mode with a 16-bit address field, or by using Indirect Addressing mode using a working register as an Address Pointer.

FIGURE 3-3: DATA MEMORY MAP FOR PIC24H DEVICES WITH 8 KBYTES RAM

FIGURE 3-4: DATA MEMORY MAP FOR PIC24H DEVICES WITH 16 KBYTES RAM

### 3.2.5 DMA RAM

Every PIC24H device contains 2 Kbytes of dual ported DMA RAM located at the end of data space. Memory locations in the DMA RAM space are accessible simultaneously by the CPU and the DMA controller module. DMA RAM is utilized by the DMA controller to store data to be transferred to various peripherals using DMA, as well as data transferred from various

peripherals using DMA. The DMA RAM can be accessed by the DMA controller without having to steal cycles from the CPU.

When the CPU and the DMA controller attempt to concurrently write to the same DMA RAM location, the hardware ensures that the CPU is given precedence in accessing the DMA RAM location. Therefore, the DMA RAM provides a reliable means of transferring DMA data without ever having to stall the CPU.

**Note:** DMA RAM can be used for general purpose data storage if the DMA function is not required in an application.

#### 3.2.6 SOFTWARE STACK

In addition to its use as a working register, the W15 register in the PIC24H devices is also used as a software Stack Pointer. The Stack Pointer always points to the first available free word and grows from lower to higher addresses. It pre-decrements for stack pops and post-increments for stack pushes, as shown in Figure 3-5. For a PC push during any CALL instruction, the MSB of the PC is zero-extended before the push, ensuring that the MSB is always clear.

Note: A PC push during exception processing concatenates the SRL register to the MSB of the PC prior to the push.

The Stack Pointer Limit register (SPLIM) associated with the Stack Pointer sets an upper address boundary for the stack. SPLIM is uninitialized at Reset. As is the case for the Stack Pointer, SPLIM<0> is forced to '0' because all stack operations must be word-aligned. Whenever an EA is generated using W15 as a source or destination pointer, the resulting address is compared with the value in SPLIM. If the contents of the Stack Pointer (W15) and the SPLIM register are equal and a push operation is performed, a stack error trap will not occur. The stack error trap will occur on a subsequent push operation. Thus, for example, if it is desirable to cause a stack error trap when the stack grows beyond address 0x2000 in RAM, initialize the SPLIM with the value 0x1FFE.

Similarly, a Stack Pointer underflow (stack error) trap is generated when the Stack Pointer address is found to be less than 0x0800. This prevents the stack from interfering with the Special Function Register (SFR) space.

A write to the SPLIM register should not be immediately followed by an indirect read operation using W15.

FIGURE 3-5: CALL STACK FRAME

#### 3.2.7 DATA RAM PROTECTION FEATURE

The PIC24H product family supports Data RAM protection features that enable segments of RAM to be protected when used in conjunction with Boot and Secure Code Segment Security. BSRAM (Secure RAM segment for BS) is accessible only from the Boot Segment Flash code, when enabled. SSRAM (Secure RAM segment for RAM) is accessible only from the Secure Segment Flash code, when enabled. See Table 3-1 for an overview of the BSRAM and SSRAM SFRs.

#### 3.3 Instruction Addressing Modes

The addressing modes in Table 3-32 form the basis of the addressing modes optimized to support the specific features of individual instructions. The addressing modes provided in the MAC class of instructions are somewhat different from those in the other instruction types.

#### 3.3.1 FILE REGISTER INSTRUCTIONS

Most file register instructions use a 13-bit address field (f) to directly address data present in the first 8192 bytes of data memory (Near Data Space). Most file register instructions employ a working register, W0, which is denoted as WREG in these instructions. The destination is typically either the same file register or WREG (with the exception of the MUL instruction), which writes the result to a register or register pair. The MOV instruction allows additional flexibility and can access the entire data space.

#### 3.3.2 MCU INSTRUCTIONS

The 3-operand MCU instructions are of the form:

Operand 3 = Operand 1 < function > Operand 2

where Operand 1 is always a working register (i.e., the addressing mode can only be Register Direct) which is referred to as Wb. Operand 2 can be a W register, fetched from data memory, or a 5-bit literal. The result location can be either a W register or a data memory location. The following addressing modes are supported by MCU instructions:

- · Register Direct
- · Register Indirect
- · Register Indirect Post-Modified
- Register Indirect Pre-Modified
- 5-bit or 10-bit Literal

**Note:** Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

TABLE 3-32: FUNDAMENTAL ADDRESSING MODES SUPPORTED

| Addressing Mode                        | Description  |
|--|--|
| File Register Direct                   | The address of the file register is specified explicitly.  |
| Register Direct                        | The contents of a register are accessed directly.  |
| Register Indirect                      | The contents of Wn forms the EA.   |
| Register Indirect Post-Modified        | The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value. |
| Register Indirect Pre-Modified         | Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.             |
| Register Indirect with Register Offset | The sum of Wn and Wb forms the EA.   |
| Register Indirect with Literal Offset  | The sum of Wn and a literal forms the EA.  |

#### 3.3.3 MOVE INSTRUCTIONS

Move instructions provide a greater degree of addressing flexibility than other instructions. In addition to the Addressing modes supported by most MCU instructions, move instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the Addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared between both source and destination (but typically only used by one).

In summary, the following Addressing modes are supported by move instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-modified
- · Register Indirect Pre-modified
- Register Indirect with Register Offset (Indexed)
- · Register Indirect with Literal Offset
- 8-bit Literal
- 16-bit Literal

**Note:** Not all instructions support all the Addressing modes given above. Individual instructions may support different subsets of these Addressing modes.

#### 3.3.4 OTHER INSTRUCTIONS

Besides the various addressing modes outlined above, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, the source of an operand or result is implied by the opcode itself. Certain operations, such as NOP, do not have any operands.

# 3.4 Interfacing Program and Data Memory Spaces

The PIC24H architecture uses a 24-bit wide program space and a 16-bit wide data space. The architecture is also a modified Harvard scheme, meaning that data can also be present in the program space. To use this data successfully, it must be accessed in a way that preserves the alignment of information in both spaces.

Aside from normal execution, the PIC24H architecture provides two methods by which program space can be accessed during operation:

- Using table instructions to access individual bytes or words anywhere in the program space
- Remapping a portion of the program space into the data space (Program Space Visibility)

Table instructions allow an application to read or write to small areas of the program memory. This capability makes the method ideal for accessing data tables that need to be updated from time to time. It also allows access to all bytes of the program word. The remapping method allows an application to access a large block of data on a read-only basis, which is ideal for look ups from a large table of static data. It can only access the least significant word of the program word.

#### 3.4.1 ADDRESSING PROGRAM SPACE

Since the address ranges for the data and program spaces are 16 and 24 bits, respectively, a method is needed to create a 23-bit or 24-bit program address from 16-bit data registers. The solution depends on the interface method to be used.

For table operations, the 8-bit Table Page register (TBLPAG) is used to define a 32K word region within the program space. This is concatenated with a 16-bit EA to arrive at a full 24-bit program space address. In this format, the Most Significant bit of TBLPAG is used to determine if the operation occurs in the user memory (TBLPAG<7> = 0) or the configuration memory (TBLPAG<7> = 1).

### PIC24H

For remapping operations, the 8-bit Program Space Visibility register (PSVPAG) is used to define a 16K word page in the program space. When the Most Significant bit of the EA is '1', PSVPAG is concatenated with the lower 15 bits of the EA to form a 23-bit program space address. Unlike table operations, this limits remapping operations strictly to the user memory area.

Table 3-33 and Figure 3-6 show how the program EA is created for table operations and remapping accesses from the data EA. Here, P<23:0> refers to a program space word, whereas D<15:0> refers to a data space word.

TABLE 3-33: PROGRAM SPACE ADDRESS CONSTRUCTION

| Access Type              | Access        | Program Space Address |               |                     |                                |     |  |
|--------------------------|---------------|-----------------------|---------------|---------------------|--------------------------------|-----|--|
| Access Type              | Space         | <23>                  | <22:16>       | <15>                | <14:1>                         | <0> |  |
| Instruction Access       | User          | 0 PC<22:1>            |               |                     |                                | 0   |  |
| (Code Execution)         |               | 0xx xxxx xx           |               |                     | xxx xxxx xxxx xxx0             |     |  |
| TBLRD/TBLWT              | User          | TBLPAG<7:0>           |               | Data EA<15:0>       |                                |     |  |
| (Byte/Word Read/Write)   |               | 0xxx xxxx xxxx xxx    |               |                     | xx xxxx xxxx                   |     |  |
|                          | Configuration | TBLPAG<7:0> 1xxx xxxx |               | Data EA<15:0>       |                                |     |  |
|                          |               |                       |               | xxxx xxxx xxxx xxxx |                                |     |  |
| Program Space Visibility | User          | 0                     | 0 PSVPAG<7:0> |                     | > Data EA<14:0> <sup>(1)</sup> |     |  |
| (Block Remap/Read)       |               | 0                     | xxxx xxxx     |                     | xxx xxxx xxxx xxxx             |     |  |

**Note 1:** Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

# 3.4.2 DATA ACCESS FROM PROGRAM MEMORY USING TABLE INSTRUCTIONS

The TBLRDL and TBLWTL instructions offer a direct method of reading or writing the lower word of any address within the program space without going through data space. The TBLRDH and TBLWTH instructions are the only method to read or write the upper 8 bits of a program space word as data.

The PC is incremented by two for each successive 24-bit program word. This allows program memory addresses to directly map to data space addresses. Program memory can thus be regarded as two 16-bit, word wide address spaces, residing side by side, each with the same address range. TBLRDL and TBLWTL access the space which contains the least significant data word and TBLRDH and TBLWTH access the space which contains the upper data byte.

Two table instructions are provided to move byte or word sized (16-bit) data to and from program space. Both function as either byte or word operations.

 TBLRDL (Table Read Low): In Word mode, it maps the lower word of the program space location (P<15:0>) to a data address (D<15:0>).

In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when Byte Select is '1'; the lower byte is selected when it is '0'.  TBLRDH (Table Read High): In Word mode, it maps the entire upper word of a program address (P<23:16>) to a data address. Note that D<15:8>, the 'phantom byte', will always be '0'.

In Byte mode, it maps the upper or lower byte of the program word to D<7:0> of the data address, as above. Note that the data will always be '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, TBLWTH and TBLWTL, are used to write individual bytes or words to a program space address. The details of their operation are explained in **Section 4.0 "Flash Program Memory"**.

For all table operations, the area of program memory space to be accessed is determined by the Table Page register (TBLPAG). TBLPAG covers the entire program memory space of the device, including user and configuration spaces. When TBLPAG<7> = 0, the table page is located in the user memory space. When TBLPAG<7> = 1, the page is located in configuration space.

FIGURE 3-7: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS

# 3.4.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into any 16K word page of the program space. This option provides transparent access of stored constant data from the data space without the need to use special instructions (i.e., TBLRDL/H).

Program space access through the data space occurs if the Most Significant bit of the data space EA is '1' and program space visibility is enabled by setting the PSV bit in the Core Control register (CORCON<2>). The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page register (PSVPAG). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits. Note that by incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads to this area add an additional cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address, 8000h and higher, maps directly into a corresponding program memory address (see Figure 3-8), only the lower 16 bits of the

24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

**Note:** PSV access is temporarily disabled during table reads/writes.

For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions require one instruction cycle in addition to the specified execution time. All other instructions require two instruction cycles in addition to the specified execution time.

For operations that use PSV, which are executed inside a REPEAT loop, there will be some instances that require two instruction cycles in addition to the specified execution time of the instruction:

- · Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction accessing data, using PSV, to execute in a single cycle.

FIGURE 3-8: PROGRAM SPACE VISIBILITY OPERATION

NOTES:

#### 4.0 FLASH PROGRAM MEMORY

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The PIC24H devices contain internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable during normal operation over the entire VDD range.

Flash memory can be programmed in two ways:

- In-Circuit Serial Programming™ (ICSP™) programming capability
- 2. Run-Time Self-Programming (RTSP)

ICSP programming capability allows a PIC24H device to be serially programmed while in the end application circuit. This is simply done with two lines for programming clock and programming data (one of the alternate programming pin pairs: PGC1/PGD1, PGC2/PGD2 or PGC3/PGD3, and three other lines for power (VDD), ground (Vss) and Master Clear (MCLR). This allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

RTSP is accomplished using TBLRD (table read) and TBLWT (table write) instructions. With RTSP, the user can write program memory data either in blocks or 'rows' of 64 instructions (192 bytes) at a time, or single instructions and erase program memory in blocks or 'pages' of 512 instructions (1536 bytes) at a time.

# 4.1 Table Instructions and Flash Programming

Regardless of the method used, all programming of Flash memory is done with the table read and table write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using bits<7:0> of the TBLPAG register and the Effective Address (EA) from a W register specified in the table instruction, as shown in Figure 4-1.

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 4-1: ADDRESSING FOR TABLE REGISTERS

#### 4.2 RTSP Operation

The PIC24H Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user to erase a page of memory, which consists of eight rows (512 instructions) at a time, and to program one row or one word at a time. **TABLE 23-11: "DC Characteristics: Program Memory"** displays typical erase and programming times. The 8-row erase pages and single row write rows are edge-aligned, from the beginning of program memory, on boundaries of 1536 bytes and 192 bytes, respectively.

The program memory implements holding buffers that can contain 64 instructions of programming data. Prior to the actual programming operation, the write data must be loaded into the buffers in sequential order. The instruction words loaded must always be from a group of 64 boundary.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of TBLWT instructions to load the buffers. Programming is performed by setting the control bits in the NVMCON register. A total of 64 TBLWTL and TBLWTH instructions are required to load the instructions.

All of the table write operations are single-word writes (two instruction cycles) because only the buffers are written. A programming cycle is required for programming each row.

#### 4.3 Control Registers

There are two SFRs used to read and write the program Flash memory: NVMCON and NVMKEY.

The NVMCON register (Register 4-1) controls which blocks are to be erased, which memory type is to be programmed and the start of the programming cycle.

NVMKEY is a write-only register that is used for write protection. To start a programming or erase sequence, the user must consecutively write 55h and AAh to the NVMKEY register. Refer to **Section 4.4 "Programming Operations"** for further details.

#### 4.4 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. A programming operation is nominally 4 ms in duration and the processor stalls (waits) until the operation is finished. Setting the WR bit (NVMCON<15>) starts the operation, and the WR bit is automatically cleared when the operation is finished.

#### REGISTER 4-1: NVMCON: FLASH MEMORY CONTROL REGISTER

| R/SO-0 <sup>(1)</sup> | R/W-0 <sup>(1)</sup> | R/W-0 <sup>(1)</sup> | U-0 | U-0 | U-0 | U-0 | U-0   |
|-----------------------|----------------------|----------------------|-----|-----|-----|-----|-------|
| WR                    | WREN                 | WRERR                | _   | _   | _   | _   | _     |
| bit 15                |                      |                      |     |     |     |     | bit 8 |

| U-0   | R/W-0 <sup>(1)</sup> | U-0 | U-0 | R/W-0 <sup>(1)</sup> | R/W-0 <sup>(1)</sup> | R/W-0 <sup>(1)</sup>              | R/W-0 <sup>(1)</sup> |

| _     | ERASE                | _   | _   |                      | NVMOP                | <sup>2</sup> <3:0> <sup>(2)</sup> |                      |
| bit 7 |                      |     |     | _                    |                      |                                   | bit 0                |

| Legend:           | SO = Satiable only bit |                             |                    |
|-------------------|------------------------|-----------------------------|--------------------|
| R = Readable bit  | W = Writable bit       | U = Unimplemented bit, read | d as '0'           |
| -n = Value at POR | '1' = Bit is set       | '0' = Bit is cleared        | x = Bit is unknown |

bit 15 WR: Write Control bit

- 1 = Initiates a Flash memory program or erase operation. The operation is self-timed and the bit is cleared by hardware once operation is complete.
- 0 = Program or erase operation is complete and inactive

bit 14 WREN: Write Enable bit

1 = Enable Flash program/erase operations0 = Inhibit Flash program/erase operations

bit 13 WRERR: Write Sequence Error Flag bit

- 1 = An improper program or erase sequence attempt or termination has occurred (bit is set automatically on any set attempt of the WR bit)
- 0 = The program or erase operation completed normally

bit 12-7 **Unimplemented:** Read as '0'

bit 6 **ERASE:** Erase/Program Enable bit

- 1 = Perform the erase operation specified by NVMOP<3:0> on the next WR command
- 0 = Perform the program operation specified by NVMOP<3:0> on the next WR command

bit 5-4 Unimplemented: Read as '0'

bit 3-0 **NVMOP<3:0>:** NVM Operation Select bits<sup>(2)</sup>

1111 = Memory bulk erase operation (ERASE = 1) or no operation (ERASE = 0)

1110 = Reserved

1101 = Erase General Segment and FGS Configuration Register

(ERASE = 1) or no operation (ERASE = 0)

1100 = Erase Secure Segment and FSS Configuration Register

(ERASE = 1) or no operation (ERASE = 0)

1011-0100 = Reserved

0011 = Memory word program operation (ERASE = 0) or no operation (ERASE = 1)

0010 = Memory page erase operation (ERASE = 1) or no operation (ERASE = 0)

0001 = Memory row program operation (ERASE = 0) or no operation (ERASE = 1)

0000 = Program or erase a single Configuration register byte

Note 1: These bits can only be reset on POR.

2: All other combinations of NVMOP<3:0> are unimplemented.

### 4.4.1 PROGRAMMING ALGORITHM FOR FLASH PROGRAM MEMORY

The user can program one row of program Flash memory at a time. To do this, it is necessary to erase the 8-row erase page that contains the desired row. The general process is:

- 1. Read eight rows of program memory (512 instructions) and store in data RAM.
- Update the program data in RAM with the desired new data.
- 3. Erase the page (see Example 4-1):
  - a) Set the NVMOP bits (NVMCON<3:0>) to '0010' to configure for block erase. Set the ERASE (NVMCON<6>) and WREN (NVMCON<14>) bits.
  - Write the starting address of the page to be erased into the TBLPAG and W registers.
  - Perform a dummy table write operation (TBLWTL) to any address within the page that needs to be erased.
  - d) Write 0x55 to NVMKEY.
  - e) Write 0xAA to NVMKEY.
  - f) Set the WR bit (NVMCON<15>). The erase cycle begins and the CPU stalls for the duration of the erase cycle. When the erase is done, the WR bit is cleared automatically.

- 4. Write the first 64 instructions from data RAM into the program memory buffers (see Example 4-2).
- 5. Write the program block to Flash memory:
  - Set the NVMOP bits to '0001' to configure for row programming. Clear the ERASE bit and set the WREN bit.
  - b) Write 0x55 to NVMKEY.
  - c) Write 0xAA to NVMKEY.
  - d) Set the WR bit. The programming cycle begins and the CPU stalls for the duration of the write cycle. When the write to Flash memory is done, the WR bit is cleared automatically.
- Repeat steps 4 and 5, using the next available 64 instructions from the block in data RAM by incrementing the value in TBLPAG, until all 512 instructions are written back to Flash memory.

For protection against accidental operations, the write initiate sequence for NVMKEY must be used to allow any erase or program operation to proceed. After the programming command has been executed, the user must wait for the programming time until programming is complete. The two instructions following the start of the programming sequence should be NOPS, as shown in Example 4-3.

#### **EXAMPLE 4-1: ERASING A PROGRAM MEMORY PAGE**

```
; Set up NVMCON for block erase operation
       MOV
               #0x4042, W0
       MOV
               WO, NVMCON
                                              ; Initialize NVMCON
; Init pointer to row to be ERASED
               #tblpage(PROG_ADDR), W0
       MOV.
                                             ; Initialize PM Page Boundary SFR
       MOV
               WO. TBLPAG
               #tbloffset(PROG ADDR), W0
                                             ; Initialize in-page EA<15:0> pointer
       TBLWTL WO, [WO]
                                             ; Set base address of erase block
       DISI
               #5
                                              ; Block all interrupts with priority <7
                                              ; for next 5 instructions
       MOV
               #0x55, W0
       MOV
               WO, NVMKEY
                                             ; Write the 55 key
       MOV
               #0xAA, W1
       MOV
               W1, NVMKEY
                                             ; Write the AA key
       BSET
               NVMCON, #WR
                                              ; Start the erase sequence
       NOP
                                              ; Insert two NOPs after the erase
       NOP
                                              ; command is asserted
```

#### Note:

A program memory page erase operation is set up by performing a dummy table write (TBLWTL) operation to any address within the page. This methodology is different from the page erase operation on dsPIC30F devices in which the erase page was selected using a dedicated pair of registers (NVMADRU and NVMADR).

#### **EXAMPLE 4-2: LOADING THE WRITE BUFFERS**

```
; Set up NVMCON for row programming operations

NOTES:

#### 5.0 RESETS

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The Reset module combines all Reset sources and controls the device Master Reset Signal, SYSRST. The following is a list of device Reset sources:

POR: Power-on ResetBOR: Brown-out Reset

• MCLR: Master Clear Pin Reset

• SWR: RESET Instruction

• WDT: Watchdog Timer Reset

• TRAPR: Trap Conflict Reset

 IOPUWR: Illegal Opcode and Uninitialized W Register Reset

A simplified block diagram of the Reset module is shown in Figure 5-1.

Any active source of Reset will make the SYSRST signal active. Many registers associated with the CPU and peripherals are forced to a known Reset state. Most registers are unaffected by a Reset; their status is unknown on POR and unchanged by all other Resets.

Note: Refer to the specific peripheral or CPU section of this manual for register Reset

All types of device Reset will set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 5-1). A POR will clear all bits, except for the POR bit (RCON<0>), that are set. The user can set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software does not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note:

The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

FIGURE 5-1: RESET SYSTEM BLOCK DIAGRAM

#### REGISTER 5-1: RCON: RESET CONTROL REGISTER<sup>(1)</sup>

| R/W-0  | R/W-0  | U-0 | U-0 | U-0 | U-0 | U-0 | R/W-0 |
|--------|--------|-----|-----|-----|-----|-----|-------|
| TRAPR  | IOPUWR | _   | _   | _   | _   | _   | VREGS |
| bit 15 |        |     |     |     |     |     | bit 8 |

| R/W-0 | R/W-0 | R/W-0                 | R/W-0 | R/W-0 | R/W-0 | R/W-1 | R/W-1 |
|-------|-------|-----------------------|-------|-------|-------|-------|-------|
| EXTR  | SWR   | SWDTEN <sup>(2)</sup> | WDTO  | SLEEP | IDLE  | BOR   | POR   |
| bit 7 |       |                       |       |       |       |       | bit 0 |

Legend:

R = Readable bit W = Writable bit U = Unimplemented bit, read as '0'

-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15 TRAPR: Trap Reset Flag bit

1 = A Trap Conflict Reset has occurred

0 = A Trap Conflict Reset has not occurred

bit 14 IOPUWR: Illegal Opcode or Uninitialized W Access Reset Flag bit

1 = An illegal opcode detection, an illegal address mode or uninitialized W register used as an

Address Pointer caused a Reset

0 = An illegal opcode or uninitialized W Reset has not occurred

bit 13-9 Unimplemented: Read as '0'

bit 8 VREGS: Voltage Regulator Standby During Sleep bit

1 = Voltage regulator goes into Standby mode during Sleep

0 = Voltage regulator is active during Sleep

bit 7 **EXTR:** External Reset (MCLR) Pin bit

1 = A Master Clear (pin) Reset has occurred

0 = A Master Clear (pin) Reset has not occurred

bit 6 **SWR:** Software Reset (Instruction) Flag bit

1 = A RESET instruction has been executed

0 = A RESET instruction has not been executed

bit 5 **SWDTEN:** Software Enable/Disable of WDT bit<sup>(2)</sup>

1 = WDT is enabled

0 = WDT is disabled

bit 4 WDTO: Watchdog Timer Time-out Flag bit

1 = WDT time-out has occurred

0 = WDT time-out has not occurred

bit 3 SLEEP: Wake-up from Sleep Flag bit

1 = Device has been in Sleep mode

0 = Device has not been in Sleep mode

bit 2 **IDLE:** Wake-up from Idle Flag bit

1 = Device was in Idle mode

0 = Device was not in Idle mode

bit 1 BOR: Brown-out Reset Flag bit

1 = A Brown-out Reset has occurred

0 = A Brown-out Reset has not occurred

**Note 1:** All of the Reset status bits may be set or cleared in software. Setting one of these bits in software does not cause a device Reset.

2: If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

### REGISTER 5-1: RCON: RESET CONTROL REGISTER<sup>(1)</sup>

bit 0 **POR:** Power-on Reset Flag bit

1 = A Power-on Reset has occurred 0 = A Power-on Reset has not occurred

- **Note 1:** All of the Reset status bits may be set or cleared in software. Setting one of these bits in software does not cause a device Reset.
  - **2:** If the FWDTEN Configuration bit is '1' (unprogrammed), the WDT is always enabled, regardless of the SWDTEN bit setting.

TABLE 5-1: RESET FLAG BIT OPERATION

| Flag Bit          | Setting Event                                     | Clearing Event          |
|-------------------|---|-------------------------|
| TRAPR (RCON<15>)  | Trap conflict event                               | POR                     |
| IOPUWR (RCON<14>) | Illegal opcode or uninitialized W register access | POR                     |
| EXTR (RCON<7>)    | MCLR Reset  | POR                     |
| SWR (RCON<6>)     | RESET instruction                                 | POR                     |
| WDTO (RCON<4>)    | WDT time-out                                      | PWRSAV instruction, POR |
| SLEEP (RCON<3>)   | PWRSAV #SLEEP instruction                         | POR                     |
| IDLE (RCON<2>)    | PWRSAV #IDLE instruction                          | POR                     |
| BOR (RCON<1>)     | BOR   | _                       |
| POR (RCON<0>)     | POR   | _                       |

Note: All Reset flag bits may be set or cleared by the user software.

#### 5.1 Clock Source Selection at Reset

If clock switching is enabled, the system clock source at device Reset is chosen, as shown in Table 5-2. If clock switching is disabled, the system clock source is always selected according to the oscillator Configuration bits. Refer to **Section 8.0** "Oscillator Configuration" for further details.

TABLE 5-2: OSCILLATOR SELECTION vs.
TYPE OF RESET (CLOCK
SWITCHING ENABLED)

| Reset Type | Clock Source Determinant      |
|------------|-------------------------------|
| POR        | Oscillator Configuration bits |
| BOR        | (FNOSC<2:0>)                  |
| MCLR       | COSC Control bits             |
| WDTR       | (OSCCON<14:12>)               |
| SWR        |                               |

#### 5.2 Device Reset Times

The Reset times for various types of device Reset are summarized in Table 5-3. The system Reset signal is released after the POR and PWRT delay times expire.

The time at which the device actually begins to execute code also depends on the system oscillator delays, which include the Oscillator Start-up Timer (OST) and the PLL lock time. The OST and PLL lock times occur in parallel with the applicable reset delay times.

The FSCM delay determines the time at which the FSCM begins to monitor the system clock source after the reset signal is released.

| <b>TABLE 5-3:</b> | RESET DELA | Y TIMES FOR | VARIOUS | DEVICE RESETS |
|-------------------|------------|-------------|---------|---------------|
|                   |            |             |         |               |

| Reset Type      | Clock Source  | SYSRST Delay           | System Clock<br>Delay | FSCM<br>Delay | Notes            |
|-----------------|---------------|------------------------|-----------------------|---------------|------------------|
| POR             | EC, FRC, LPRC | TPOR + TSTARTUP + TRST | _                     |               | 1, 2, 3          |
|                 | ECPLL, FRCPLL | TPOR + TSTARTUP + TRST | TLOCK                 | TFSCM         | 1, 2, 3, 5, 6    |
|                 | XT, HS, SOSC  | TPOR + TSTARTUP + TRST | Tost                  | TFSCM         | 1, 2, 3, 4, 6    |
|                 | XTPLL, HSPLL  | TPOR + TSTARTUP + TRST | Tost + Tlock          | TFSCM         | 1, 2, 3, 4, 5, 6 |
| MCLR            | Any Clock     | Trst                   | _                     |               | 3                |
| WDT             | Any Clock     | Trst                   | _                     | _             | 3                |
| Software        | Any clock     | Trst                   | _                     | _             | 3                |
| Illegal Opcode  | Any Clock     | Trst                   | _                     | _             | 3                |
| Uninitialized W | Any Clock     | Trst                   | _                     | _             | 3                |
| Trap Conflict   | Any Clock     | Trst                   | _                     |               | 3                |

- **Note 1:** TPOR = Power-on Reset delay (10 μs nominal).
  - 2: TSTARTUP = Conditional POR delay of 20 μs nominal (if on-chip regulator is enabled) or 64 ms nominal Power-up Timer delay (if regulator is disabled). TSTARTUP is also applied to all returns from powered-down states, including waking from Sleep mode, only if the regulator is enabled.
  - 3: TRST = Internal state Reset time (20 µs nominal).
  - **4:** Tost = Oscillator Start-up Timer. A 10-bit counter counts 1024 oscillator periods before releasing the oscillator clock to the system.
  - **5:** TLOCK = PLL lock time (20 μs nominal).
  - **6:** TFSCM = Fail-Safe Clock Monitor delay (100 μs nominal).

### 5.2.1 POR AND LONG OSCILLATOR START-UP TIMES

The oscillator start-up circuitry and its associated delay timers are not linked to the device Reset delays that occur at power-up. Some crystal circuits (especially low-frequency crystals) have a relatively long start-up time. Therefore, one or more of the following conditions is possible after the Reset signal is released:

- The oscillator circuit has not begun to oscillate.
- The Oscillator Start-up Timer has not expired (if a crystal oscillator is used).
- The PLL has not achieved a lock (if PLL is used).

The device will not begin to execute code until a valid clock source has been released to the system. Therefore, the oscillator and PLL start-up delays must be considered when the Reset delay time must be known.

# 5.2.2 FAIL-SAFE CLOCK MONITOR (FSCM) AND DEVICE RESETS

If the FSCM is enabled, it begins to monitor the system clock source when the Reset signal is released. If a valid clock source is not available at this time, the device automatically switches to the FRC oscillator and the user can switch to the desired crystal oscillator in the Trap Service Routine.

### 5.2.2.1 FSCM Delay for Crystal and PLL Clock Sources

When the system clock source is provided by a crystal oscillator and/or the PLL, a small delay, TFSCM, is automatically inserted after the POR and PWRT delay times. The FSCM does not begin to monitor the system clock source until this delay expires. The FSCM delay time is nominally 100  $\mu s$  and provides additional time for the oscillator and/or PLL to stabilize. In most cases, the FSCM delay prevents an oscillator failure trap at a device Reset when the PWRT is disabled.

# 5.3 Special Function Register Reset States

Most of the Special Function Registers (SFRs) associated with the CPU and peripherals are reset to a particular value at a device Reset. The SFRs are grouped by their peripheral or CPU function and their Reset values are specified in each section of this manual.

The Reset value for each SFR does not depend on the type of Reset, with the exception of two registers. The Reset value for the Reset Control register, RCON, depends on the type of device Reset. The Reset value for the Oscillator Control register, OSCCON, depends on the type of Reset and the programmed values of the oscillator Configuration bits in the FOSC Configuration register.

NOTES:

#### 6.0 INTERRUPT CONTROLLER

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The PIC24H interrupt controller reduces the numerous peripheral interrupt request signals to a single interrupt request signal to the PIC24H CPU. It has the following features:

- Up to 8 processor exceptions and software traps
- 7 user-selectable priority levels
- Interrupt Vector Table (IVT) with up to 118 vectors
- A unique vector for each interrupt or exception source
- · Fixed priority within a specified user priority level
- Alternate Interrupt Vector Table (AIVT) for debug support
- · Fixed interrupt entry and return latencies

#### 6.1 Interrupt Vector Table

The Interrupt Vector Table (IVT) is shown in Figure 6-1. The IVT resides in program memory, starting at location 000004h. The IVT contains 126 vectors consisting of 8 nonmaskable trap vectors plus up to 118 sources of interrupt. In general, each interrupt source has its own vector. Each interrupt vector contains a 24-bit wide address. The value programmed into each interrupt vector location is the starting address of the associated Interrupt Service Routine (ISR).

Interrupt vectors are prioritized in terms of their natural priority; this priority is linked to their position in the vector table. All other things being equal, lower addresses have a higher natural priority. For example, the interrupt associated with vector 0 will take priority over interrupts at any other vector address.

PIC24H devices implement up to 61 unique interrupts and 5 nonmaskable traps. These are summarized in Table 6-1 and Table 6-2.

#### 6.1.1 ALTERNATE VECTOR TABLE

The Alternate Interrupt Vector Table (AIVT) is located after the IVT, as shown in Figure 6-1. Access to the AIVT is provided by the ALTIVT control bit (INTCON2<15>). If the ALTIVT bit is set, all interrupt and exception processes use the alternate vectors instead of the default vectors. The alternate vectors are organized in the same manner as the default vectors.

The AIVT supports debugging by providing a means to switch between an application and a support environment without requiring the interrupt vectors to be reprogrammed. This feature also enables switching between applications for evaluation of different software algorithms at run time. If the AIVT is not needed, the AIVT should be programmed with the same addresses used in the IVT.

#### 6.2 Reset Sequence

A device Reset is not a true exception because the interrupt controller is not involved in the Reset process. The PIC24H device clears its registers in response to a Reset which forces the PC to zero. The digital signal controller then begins program execution at location 0x000000. The user programs a GOTO instruction at the Reset address which redirects program execution to the appropriate start-up routine.

Note:

Any unimplemented or unused vector locations in the IVT and AIVT should be programmed with the address of a default interrupt handler routine that contains a RESET instruction.

FIGURE 6-1: PIC24H INTERRUPT VECTOR TABLE Reset - GOTO Instruction 0x000000 Reset - GOTO Address 0x000002 Reserved 0x000004 Oscillator Fail Trap Vector Address Error Trap Vector Stack Error Trap Vector Math Error Trap Vector DMA Error Trap Vector Reserved Reserved Interrupt Vector 0 0x000014 Interrupt Vector 1 Interrupt Vector 52 0x00007C Interrupt Vector Table (IVT)<sup>(1)</sup> Interrupt Vector 53 0x00007E Decreasing Natural Order Priority Interrupt Vector 54 0x000080 ~ Interrupt Vector 116 0x0000FC Interrupt Vector 117 0x0000FE 0x000100 Reserved Reserved 0x000102 Reserved Oscillator Fail Trap Vector Address Error Trap Vector Stack Error Trap Vector Math Error Trap Vector DMA Error Trap Vector Reserved Reserved Interrupt Vector 0 0x000114 Interrupt Vector 1 Alternate Interrupt Vector Table (AIVT)(1) Interrupt Vector 52 0x00017C Interrupt Vector 53 0x00017E Interrupt Vector 54 0x000180 Interrupt Vector 116 Interrupt Vector 117 0x0001FE Start of Code 0x000200 Note 1: See Table 6-1 for the list of implemented interrupt vectors.

# 6.3 Interrupt Control and Status Registers

PIC24H devices implement a total of 30 registers for the interrupt controller:

- INTCON1
- INTCON2
- IFS0 through IFS4
- IEC0 through IEC4
- IPC0 through IPC17
- INTTREG

Global interrupt control functions are controlled from INTCON1 and INTCON2. INTCON1 contains the Interrupt Nesting Disable (NSTDIS) bit as well as the control and status flags for the processor trap sources. The INTCON2 register controls the external interrupt request signal behavior and the use of the Alternate Interrupt Vector Table.

The IFS registers maintain all of the interrupt request flags. Each source of interrupt has a Status bit, which is set by the respective peripherals or external signal and is cleared via software.

The IEC registers maintain all of the interrupt enable bits. These control bits are used to individually enable interrupts from the peripherals or external signals. The IPC registers are used to set the interrupt priority level for each source of interrupt. Each user interrupt source can be assigned to one of eight priority levels.

The INTTREG register contains the associated interrupt vector number and the new CPU interrupt priority level, which are latched into vector number (VEC-NUM<6:0>) and Interrupt level (ILR<3:0>) bit fields in the INTTREG register. The new interrupt priority level is the priority of the pending interrupt.

The interrupt sources are assigned to the IFSx, IECx and IPCx registers in the same sequence that they are listed in Table 6-1. For example, the INT0 (External Interrupt 0) is shown as having vector number 8 and a natural order priority of 0. Thus, the INT0IF bit is found in IFS0<0>, the INT0IE bit in IEC0<0>, and the INT0IP bits in the first position of IPC0 (IPC0<2:0>).

Although they are not specifically part of the interrupt control hardware, two of the CPU Control registers contain bits that control interrupt functionality. The CPU STATUS register, SR, contains the IPL<2:0> bits (SR<7:5>). These bits indicate the current CPU interrupt priority level. The user can change the current CPU priority level by writing to the IPL bits.

The CORCON register contains the IPL3 bit which, together with IPL<2:0>, also indicates the current CPU priority level. IPL3 is a read-only bit so that trap events cannot be masked by the user software.

All Interrupt registers are described in Register 6-1, SR: CPU STATUS Register<sup>(1)</sup> through Register 6-32, IPC17: Interrupt Priority Control Register 17, in the following pages.

### PIC24H

#### REGISTER 6-1: SR: CPU STATUS REGISTER<sup>(1)</sup>

| U-0          | U-0 | U-0 | U-0 | U-0 | U-0 | U-0 | R/W-0 |  |
|--------------|-----|-----|-----|-----|-----|-----|-------|--|
| _            | _   | _   | _   | _   | _   | _   | DC    |  |
| bit 15 bit 8 |     |     |     |     |     |     |       |  |

| R/W-0 <sup>(3)</sup> | R/W-0 <sup>(3)</sup> | R/W-0 <sup>(3)</sup> | R-0 | R/W-0 | R/W-0 | R/W-0 | R/W-0 |
|----------------------|----------------------|----------------------|-----|-------|-------|-------|-------|
| IPL2 <sup>(2)</sup>  | IPL1 <sup>(2)</sup>  | IPL0 <sup>(2)</sup>  | RA  | N     | OV    | Z     | С     |
| bit 7                | •                    | •                    | •   | •     | •     | •     | bit 0 |

Legend:

C = Clear only bit R = Readable bit U = Unimplemented bit, read as '0'

S = Set only bit W = Writable bit -n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 7-5 IPL<2:0>: CPU Interrupt Priority Level Status bits<sup>(2)</sup>

111 = CPU Interrupt Priority Level is 7 (15), user interrupts disabled

110 = CPU Interrupt Priority Level is 6 (14)

101 = CPU Interrupt Priority Level is 5 (13)

100 = CPU Interrupt Priority Level is 4 (12)

011 = CPU Interrupt Priority Level is 3 (11)

010 = CPU Interrupt Priority Level is 2 (10)

001 = CPU Interrupt Priority Level is 1 (9)

000 = CPU Interrupt Priority Level is 0 (8)

Note 1: For complete register details, see Register 2-1, SR: CPU STATUS Register.

2: The IPL<2:0> bits are concatenated with the IPL<3> bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL if IPL<3> = 1. User interrupts are disabled when IPL<3> = 1.

3: The IPL<2:0> Status bits are read-only when NSTDIS (INTCON1<15>) = 1.

#### REGISTER 6-2: CORCON: CORE CONTROL REGISTER<sup>(1)</sup>

### 6.4 Interrupt Setup Procedures

### 6.4.1 INITIALIZATION

To configure an interrupt source:

- Set the NSTDIS bit (INTCON1<15>) if nested interrupts are not desired.
- Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources may be programmed to the same non-zero value.

**Note:** At a device Reset, the IPCx registers are initialized, such that all user interrupt sources are assigned to priority level 4.

- Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
- Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

#### 6.4.2 INTERRUPT SERVICE ROUTINE

The method that is used to declare an ISR and initialize the IVT with the correct vector address will depend on the programming language (i.e., C or assembler) and the language development toolsuite that is used to develop the application. In general, the user must clear the interrupt flag in the appropriate IFSx register for the source of interrupt that the ISR handles. Otherwise, the ISR will be re-entered immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a RETFIE instruction to unstack the saved PC value, SRL value and old CPU priority level.

#### 6.4.3 TRAP SERVICE ROUTINE

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

### 6.4.4 INTERRUPT DISABLE

All user interrupts can be disabled using the following procedure:

- Push the current SR value onto the software stack using the PUSH instruction.
- 2. Force the CPU to priority level 7 by inclusive ORing the value 0x0E with SRL.

To enable user interrupts, the POP instruction may be used to restore the previous SR value.

Note that only user interrupts with a priority level of 7 or less can be disabled. Trap sources (level 8-level 15) cannot be disabled.

The DISI instruction provides a convenient way to disable interrupts of priority levels 1-6 for a fixed period of time. Level 7 interrupt sources are not disabled by the DISI instruction.

NOTES:

# 7.0 DIRECT MEMORY ACCESS (DMA)

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

Direct Memory Access (DMA) is a very efficient mechanism of copying data between peripheral SFRs (e.g., UART Receive register, Input Capture 1 buffer), and buffers or variables stored in RAM, with minimal CPU intervention. The DMA controller can automatically copy entire blocks of data without requiring the user software to read or write the peripheral Special Function Registers (SFRs) every time a peripheral interrupt occurs. The DMA controller uses a dedicated bus for data transfers and, therefore, does not steal cycles from the code execution flow of the CPU. To exploit the DMA capability, the corresponding user buffers or variables must be located in DMA RAM.

The PIC24H peripherals that can utilize DMA are listed in Table 7-1 along with their associated Interrupt Request (IRQ) numbers.

TABLE 7-1: PERIPHERALS WITH DMA SUPPORT

| Peripheral         | IRQ Number |
|--------------------|------------|
| INT0               | 0          |
| Input Capture 1    | 1          |
| Input Capture 2    | 5          |
| Output Compare 1   | 2          |
| Output Compare 2   | 6          |
| Timer2             | 7          |
| Timer3             | 8          |
| SPI1               | 10         |

| ECAN1 Transmission | 70         |
| ECAN2 Reception    | 55         |
| ECAN2 Transmission | 71         |

The DMA controller features eight identical data transfer channels.

Each channel has its own set of control and status registers. Each DMA channel can be configured to copy data either from buffers stored in dual port DMA RAM to peripheral SFRs, or from peripheral SFRs to buffers in DMA RAM.

The DMA controller supports the following features:

- · Word or byte sized data transfers.
- Transfers from peripheral to DMA RAM or DMA RAM to peripheral.
- Indirect Addressing of DMA RAM locations with or without automatic post-increment.
- Peripheral Indirect Addressing In some peripherals, the DMA RAM read/write addresses may be partially derived from the peripheral.
- One-Shot Block Transfers Terminating DMA transfer after one block transfer.
- Continuous Block Transfers Reloading DMA RAM buffer start address after every block transfer is complete.
- Ping-Pong Mode Switching between two DMA RAM start addresses between successive block transfers, thereby filling two buffers alternately.
- Automatic or manual initiation of block transfers
- Each channel can select from 19 possible sources of data sources or destinations.

For each DMA channel, a DMA interrupt request is generated when a block transfer is complete. Alternatively, an interrupt can be generated when half of the block has been filled.

### 7.1 DMAC Registers

Each DMAC Channel x (x = 0, 1, 2, 3, 4, 5, 6 or 7) contains the following registers:

- A 16-bit DMA Channel Control register (DMAxCON)
- A 16-bit DMA Channel IRQ Select register (DMAxREQ)
- A 16-bit DMA RAM Primary Start Address register (DMAxSTA)
- A 16-bit DMA RAM Secondary Start Address register (DMAxSTB)
- A 16-bit DMA Peripheral Address register (DMAxPAD)
- A 10-bit DMA Transfer Count register (DMAx-CNT)

An additional status register, DMACS, is common to all DMAC channels. It contains the DMA RAM and SFR write collision flags, XWCOLx and PWCOLx, respectively.

The DMAxCON, DMAxREQ, DMAxPAD and DMAxCNT are all conventional read/write registers. Reads of DMAxSTA or DMAxSTB will read the contents of the DMA RAM Address register. Writes to DMAxSTA or DMAxSTB write to the registers. This allows the user to determine the DMA buffer pointer value (address) at any time.

The interrupt flags (DMAxIF) are located in an IFSx register in the interrupt controller. The corresponding interrupt enable control bits (DMAxIE) are located in

an IECx register in the interrupt controller, and the corresponding interrupt priority control bits (DMAxIP) are located in an IPCx register in the interrupt controller.

### 7.2 DMAC Operating Modes

Each DMA channel has its own status and control register (DMAxCON) that is used to configure the channel to support the following operating modes:

- · Word or byte size data transfers
- Peripheral to DMA RAM or DMA RAM to peripheral transfers
- · Post-increment or static DMA RAM address
- · One-shot or continuous block transfers
- Auto-switch between two start addresses after each transfer complete (Ping-Pong mode)
- Force a single DMA transfer (Manual mode)

Each DMA channel can be independently configured to:

- Select from one of 19 DMA request sources
- · Manually enable or disable the DMA channel
- Interrupt the CPU when the transfer is half or fully complete

DMA channel interrupts are routed to the interrupt controller module and enabled through associated enable flags.

The channel DMA RAM and peripheral write collision Faults are combined into a single DMAC error trap (Level 10) and are not maskable. Each channel has DMA RAM write collision (XWCOLx) and peripheral

write collision (PWCOLx) status bits in the DMAC Status register (DMACS) to allow the DMAC error trap handler to determine the source of the Fault condition.

### 7.2.1 BYTE OR WORD TRANSFER

Each DMA channel can be configured to transfer words or bytes. As usual, words can only be moved to and from aligned (even) addresses. Bytes can be moved to or from any (legal) address.

If the SIZE bit (DMAxCON<14>) is clear, word sized data is transferred. The LSb of the DMA RAM Address register (DMAxSTA or DMAxSTB) is ignored. If Post-Increment Addressing mode is enabled, the DMA RAM Address register is incremented by 2 after every word transfer.

If the SIZE bit is set, byte sized data is transferred. If Post-Increment Addressing is enabled, the DMA RAM Address register is incremented by 1 after every byte transfer.

Note: DMAxCNT value is independent of data transfer size (byte/word). If an address offset is required, a 1-bit left shift of the counter is required to generate the correct offset for (aligned) word transfers.

### 7.2.2 ADDRESSING MODES

The DMAC supports Register Indirect and Register Indirect Post-Increment Addressing modes for DMA RAM addresses (source or destination). Each channel can select the DMA RAM Addressing mode independently. The Peripheral SFR is always accessed using Register Indirect Addressing.

If the AMODE<1:0> bits (DMAxCON<5:4>) are set to '01', Register Indirect Addressing without Post-Increment is used, which implies that the DMA RAM address remains constant.

If the AMODE<1:0> bits are clear, DMA RAM is accessed using Register Indirect Addressing with Post-Increment, which means the DMA RAM address will be incremented after every access.

Any DMA channel can be configured to operate in Peripheral Indirect Addressing mode by setting the AMODE<1:0> bits to '10'. In this mode, the DMA RAM source or destination address is partially derived from the peripheral as well as the DMA Address registers. Each peripheral module has a pre-assigned peripheral indirect address which is logically ORed with the DMA Start Address register to obtain the effective DMA RAM address. The DMA RAM Start Address register value must be aligned to a power-of-two boundary.

**Note:** Only the ECAN and A/D modules can utilize Peripheral Indirect Addressing.

#### 7.2.3 DMA TRANSFER DIRECTION

Each DMA channel can be configured to transfer data from a peripheral to DMA RAM, or from DMA RAM to a peripheral.

If the DIR bit (DMAxCON<13>) is clear, the reads occur from a peripheral SFR (using the DMA Peripheral Address register, DMAxPAD) and the writes are directed to the DMA RAM (using the DMA RAM Address register).

If the DIR bit (DMAxCON<13>) is set, the reads occur from the DMA RAM (using the DMA RAM Address register) and the writes are directed to the peripheral (using the DMA Peripheral Address register, DMAxPAD).

## 7.2.4 NULL DATA PERIPHERAL WRITE MODE

If the NULLW bit (DMAxCON<11>) is set, a null data write to the peripheral SFR is performed in addition to a data transfer from the peripheral SFR to DMA RAM (assuming the DIR bit is clear). This mode is most useful in applications in which sequential reception of data is required without any data transmission.

### 7.2.5 CONTINUOUS OR ONE-SHOT OPERATION

Each DMA channel can be configured for One-Shot or Continuous mode operation.

If MODE<0> (DMAxCON<0>) is clear, the channel operates in Continuous mode.

When all data has been moved (i.e., buffer end has been detected), the channel is automatically reconfigured for subsequent use. During the last data transfer, the next Effective Address generated will be the original start address (from the selected DMAxSTA or DMAxSTB register). If the HALF bit (DMAxCON<12>) is clear, the transfer complete interrupt flag (DMAxIF) is set. If the HALF bit is set, DMAxIF will not be set at this time and the channel will remain enabled.

If MODE<0> is set, the channel operates in One-Shot mode. When all data has been moved (i.e., buffer end has been detected), the channel is automatically disabled. During the last data transfer, no new Effective Address is generated and the DMA RAM Address register retains the last DMA RAM address that was accessed. If the HALF bit is clear, the DMAxIF bit is set. If the HALF bit is set, the DMAxIF will not be set at this time and the channel is automatically disabled.

### 7.2.6 PING-PONG MODE

When the MODE<1> bit (DMAxCON<1>) is set by the user, Ping-Pong mode is enabled.

In this mode, successive block transfers alternately select DMAxSTA and DMAxSTB as the DMA RAM start address. In this way, a single DMA channel can be used to support two buffers of the same length in DMA RAM. Using this technique maximizes data throughput by allowing the CPU time to process one buffer while the other is being loaded.

### 7.2.7 MANUAL TRANSFER MODE

A manual DMA request can be created by setting the FORCE bit (DMAxREQ<15>) in software. If already enabled, the corresponding DMA channel executes a single data element transfer rather than a block transfer.

The FORCE bit is cleared by hardware when the forced DMA transfer is complete and cannot be cleared by the user. Any attempt to set this bit prior to completion of a DMA request that is underway will have no effect.

The manual DMA transfer function is a one-time event. The DMA channel always reverts to normal operation (i.e., based on hardware DMA requests) after a forced (manual) transfer.

This mode provides the user a straightforward method of initiating a block transfer. For example, using Manual mode to transfer the first data element into a serial peripheral allows subsequent data within the buffer to be moved automatically by the DMAC using a 'transmit buffer empty' DMA request.

## 7.2.8 DMA REQUEST SOURCE SELECTION

Each DMA channel can select between one of 128 interrupt sources to be a DMA request for that channel, based on the contents of the IRQSEL<6:0> bits (DMAxREQ<6:0>. The available interrupt sources are device dependent. Please refer to Table 7-1 for IRQ numbers associated with each of the interrupt sources that can generate a DMA transfer.

### 7.3 DMA Interrupts and Traps

Each DMA channel can generate an independent 'block transfer complete' (HALF = 0) or 'half block transfer complete' (HALF = 1) interrupt. Every DMA channel has its own interrupt vector and therefore, does not use the interrupt vector of the peripheral to which it is assigned. If a peripheral contains multi-word buffers, the buffering function must be disabled in the peripheral in order to use DMA. DMA interrupt requests are only generated by data transfers and not by peripheral error conditions.

The DMA controller can also react to peripheral and DMA RAM write collision error conditions through a nonmaskable CPU trap event. A DMA error trap is generated in either of the following Fault conditions:

- DMA RAM data write collision between the CPU and a peripheral
  - This condition occurs when the CPU and a peripheral attempt to write to the same DMA RAM address simultaneously
- Peripheral SFR data write collision between the CPU and the DMA controller
  - This condition occurs when the CPU and the DMA controller attempt to write to the same peripheral SFR simultaneously

The channel DMA RAM and peripheral write collision Faults are combined into a single DMAC error trap (Level 10) and are nonmaskable. Each channel has DMA RAM Write Collision (XWCOLx) and Peripheral Write Collision (PWCOLx) status bits in the DMAC Status register (DMACS) to allow the DMAC error trap handler to determine the source of the Fault condition.

### 7.4 DMA Initialization Example

The following is a DMA initialization example:

### **EXAMPLE 7-1: DMA SAMPLE INITIALIZATION METHOD**

```
// Clear all DMA controller status bits to a known state
        DMACS0 = 0;
// Set up DMA Channel 0: Word mode, Read from Peripheral & Write to DMA; Interrupt when all the
data has been moved; Indirect with post-increment; Continuous mode with Ping-Pong Disabled
        DMAOCON = 0x000D;
//Automatic DMA transfer initiation by DMA request; DMA Peripheral IRQ Number set up for ADC1
        DMAOREQ = 0x0000;
// Set up offset into DMA RAM so that the buffer that collects A/D result data starts at the base
of DMA RAM
        DMAOSTA = 0x0000;
// DMA0PAD should be loaded with the address of the A/D conversion result register
        DMA0PAD = (volatile unsigned int) &ADC1BUF0;
// DMA transfer of 256 words of data
        DMAOCNT = 0x0100 ;
//Clear the DMA0 Interrupt Flag
        IFSObits.DMA0IF = 0;
//Enable DMA0 Interrupts
        IECObits.DMA0IE = 1;
//Enable the DMA0 Channel
        DMA0CONbits.CHEN = 1;
```

# PIC24H

**NOTES:** 

# 8.0 OSCILLATOR CONFIGURATION

Note: This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The PIC24H oscillator system provides:

- Various external and internal oscillator options as clock sources
- An on-chip PLL to scale the internal operating frequency to the required system clock frequency

- The internal FRC oscillator can also be used with the PLL, thereby allowing full-speed operation without any external clock generation hardware
- Clock switching between various clock sources
- Programmable clock postscaler for system power savings
- A Fail-Safe Clock Monitor (FSCM) that detects clock failure and takes fail-safe measures
- A Clock Control register (OSCCON)
- Nonvolatile Configuration bits for main oscillator selection.

A simplified diagram of the oscillator system is shown in Figure 8-1.

FIGURE 8-1: PIC24H OSCILLATOR SYSTEM DIAGRAM

### 8.1 CPU Clocking System

There are seven system clock options provided by the PIC24H:

- FRC Oscillator
- · FRC Oscillator with PLL
- · Primary (XT, HS or EC) Oscillator
- · Primary Oscillator with PLL
- · Secondary (LP) Oscillator
- LPRC Oscillator
- FRC Oscillator with postscaler

### 8.1.1 SYSTEM CLOCK SOURCES

The FRC (Fast RC) internal oscillator runs at a nominal frequency of 7.37 MHz. The user software can tune the FRC frequency. User software can optionally specify a factor (ranging from 1:2 to 1:256) by which the FRC clock frequency is divided. This factor is selected using the FRCDIV<2:0> (CLKDIV<10:8>) bits.

The primary oscillator can use one of the following as its clock source:

- 1. XT (Crystal): Crystals and ceramic resonators in the range of 3 MHz to 10 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- HS (High-Speed Crystal): Crystals in the range of 10 MHz to 40 MHz. The crystal is connected to the OSC1 and OSC2 pins.
- 3. EC (External Clock): External clock signal in the range of 0.8 MHz to 64 MHz. The external clock signal is directly applied to the OSC1 pin.

The secondary (LP) oscillator is designed for low power and uses a 32.768 kHz crystal or ceramic resonator. The LP oscillator uses the SOSCI and SOSCO pins.

The LPRC (Low-Power RC) internal oscillator runs at a nominal frequency of 32.768 kHz. It is also used as a reference clock by the Watchdog Timer (WDT) and Fail-Safe Clock Monitor (FSCM).

The clock signals generated by the FRC and primary oscillators can be optionally applied to an on-chip Phase Locked Loop (PLL) to provide a wide range of output frequencies for device operation. PLL configuration is described in **Section 8.1.3** "PLL Configuration".

### 8.1.2 SYSTEM CLOCK SELECTION

The oscillator source that is used at a device Power-on Reset event is selected using Configuration bit settings. The oscillator Configuration bit settings are located in the Configuration registers in the program memory. (Refer to Section 20.1 "Configuration Bits" for further details.) The Initial Oscillator Selection Configuration bits, FNOSC<2:0> (FOSCSEL<2:0>), and the Primary Oscillator Mode Select Configuration bits, POSCMD<1:0>

(FOSC<1:0>), select the oscillator source that is used at a Power-on Reset. The FRC primary oscillator is the default (unprogrammed) selection.

The Configuration bits allow users to choose between twelve different clock modes, shown in Table 8-1.

The output of the oscillator (or the output of the PLL if a PLL mode has been selected) Fosc is divided by 2 to generate the device instruction clock (FcY). FcY defines the operating speed of the device, and speeds up to 40 MHz are supported by the PIC24H architecture.

Instruction execution speed or device operating frequency, FCY, is given by:

# EQUATION 8-1: DEVICE OPERATING FREQUENCY

FCY = Fosc/2

### 8.1.3 PLL CONFIGURATION

The primary oscillator and internal FRC oscillator can optionally use an on-chip PLL to obtain higher speeds of operation. The PLL provides a significant amount of flexibility in selecting the device operating speed. A block diagram of the PLL is shown in Figure 8-2.

The output of the primary oscillator or FRC, denoted as 'FIN', is divided down by a prescale factor (N1) of 2, 3, ... or 33 before being provided to the PLL's Voltage Controlled Oscillator (VCO). The input to the VCO must be selected to be in the range of 0.8 MHz to 8 MHz. Since the minimum prescale factor is 2, this implies that FIN must be chosen to be in the range of 1.6 MHz to 16 MHz. The prescale factor 'N1' is selected using the PLLPRE<4:0> bits (CLKDIV<4:0>).

The PLL Feedback Divisor, selected using the PLLDIV<8:0> bits (PLLFBD<8:0>), provides a factor 'M', by which the input to the VCO is multiplied. This factor must be selected such that the resulting VCO output frequency is in the range of 100 MHz to 200 MHz.

The VCO output is further divided by a postscale factor 'N2'. This factor is selected using the PLLPOST<1:0> bits (CLKDIV<7:6>). 'N2' can be either 2, 4 or 8, and must be selected such that the PLL output frequency (Fosc) is in the range of 12.5 MHz to 80 MHz, which generates device operating speeds of 6.25-40 MIPS.

For a primary oscillator or FRC oscillator, output 'FIN', the PLL output 'FOSC' is given by:

### **EQUATION 8-2:** Fosc CALCULATION

$$FOSC = FIN* \left( \frac{M}{N1*N2} \right)$$

For example, suppose a 10 MHz crystal is being used, with "XT with PLL" being the selected oscillator mode. If PLLPRE<4:0> = 0, then N1 = 2. This yields a VCO input of 10/2 = 5 MHz, which is within the acceptable range of 0.8-8 MHz. If PLLDIV<8:0> = 0x1E, then M = 32. This yields a VCO output of 5 x 32 = 160 MHz, which is within the 100-200 MHz ranged needed.

If PLLPOST<1:0> = 0, then N2 = 2. This provides a Fosc of 160/2 = 80 MHz. The resultant device operating speed is 80/2 = 40 MIPS.

EQUATION 8-3: XT WITH PLL MODE EXAMPLE

$$FCY = \frac{FOSC}{2} = \frac{1}{2} \left( \frac{10000000*32}{2*2} \right) = 40 \text{ MIPS}$$

FIGURE 8-2: PIC24H PLL BLOCK DIAGRAM

TABLE 8-1: CONFIGURATION BIT VALUES FOR CLOCK SELECTION

| Oscillator Mode                                 | Oscillator Source | POSCMD<1:0> | FNOSC<2:0> | Note |

### 8.2 Clock Switching Operation

Applications are free to switch between any of the four clock sources (Primary, LP, FRC and LPRC) under software control at any time. To limit the possible side effects that could result from this flexibility, PIC24H devices have a safeguard lock built into the switch process.

Note:

Primary Oscillator mode has three different submodes (XT, HS and EC) which are determined by the POSCMD<1:0> Configuration bits. While an application can switch to and from Primary Oscillator mode in software, it cannot switch between the different primary submodes without reprogramming the device.

#### 8.2.1 ENABLING CLOCK SWITCHING

To enable clock switching, the FCKSM1 Configuration bit in the Configuration register must be programmed to '0'. (Refer to **Section 20.1 "Configuration Bits"** for further details.) If the FCKSM1 Configuration bit is unprogrammed ('1'), the clock switching function and Fail-Safe Clock Monitor function are disabled. This is the default setting.

The NOSC control bits (OSCCON<10:8>) do not control the clock selection when clock switching is disabled. However, the COSC bits (OSCCON<14:12>) reflect the clock source selected by the FNOSC Configuration bits.

The OSWEN control bit (OSCCON<0>) has no effect when clock switching is disabled. It is held at '0' at all times.

## 8.2.2 OSCILLATOR SWITCHING SEQUENCE

At a minimum, performing a clock switch requires this basic sequence:

- If desired, read the COSC bits (OSCCON<14:12>) to determine the current oscillator source.
- Perform the unlock sequence to allow a write to the OSCCON register high byte.
- Write the appropriate value to the NOSC control bits (OSCCON<10:8>) for the new oscillator source.
- Perform the unlock sequence to allow a write to the OSCCON register low byte.
- Set the OSWEN bit to initiate the oscillator switch.

Once the basic sequence is completed, the system clock hardware responds automatically as follows:

- The clock switching hardware compares the COSC status bits with the new value of the NOSC control bits. If they are the same, then the clock switch is a redundant operation. In this case, the OSWEN bit is cleared automatically and the clock switch is aborted.
- If a valid clock switch has been initiated, the LOCK (OSCCON<5>) and the CF (OSCCON<3>) status bits are cleared.
- The new oscillator is turned on by the hardware if it is not currently running. If a crystal oscillator must be turned on, the hardware waits until the Oscillator Start-up Timer (OST) expires. If the new source is using the PLL, the hardware waits until a PLL lock is detected (LOCK = 1).
- The hardware waits for 10 clock cycles from the new clock source and then performs the clock switch.
- The hardware clears the OSWEN bit to indicate a successful clock transition. In addition, the NOSC bit values are transferred to the COSC status bits.
- The old clock source is turned off at this time, with the exception of LPRC (if WDT or FSCM are enabled) or LP (if LPOSCEN remains set).
  - Note 1: The processor continues to execute code throughout the clock switching sequence.

    Timing sensitive code should not be executed during this time.
    - 2: Direct clock switches between any primary oscillator mode with PLL and FRCPLL mode are not permitted. This applies to clock switches in either direction. In these instances, the application must switch to FRC mode as a transition clock source between the two PLL modes.

### 8.3 Fail-Safe Clock Monitor (FSCM)

The Fail-Safe Clock Monitor (FSCM) allows the device to continue to operate even in the event of an oscillator failure. The FSCM function is enabled by programming. If the FSCM function is enabled, the LPRC internal oscillator runs at all times (except during Sleep mode) and is not subject to control by the Watchdog Timer.

If an oscillator failure occurs, the FSCM generates a clock failure trap event and switches the system clock over to the FRC oscillator. Then the application program can either attempt to restart the oscillator or execute a controlled shutdown. The trap can be treated as a warm Reset by simply loading the Reset address into the oscillator fail trap vector.

If the PLL multiplier is used to scale the system clock, the internal FRC is also multiplied by the same factor on clock failure. Essentially, the device switches to FRC with PLL on a clock failure.

### 9.0 POWER-SAVING FEATURES

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The PIC24H devices provide the ability to manage power consumption by selectively managing clocking to the CPU and the peripherals. In general, a lower clock frequency and a reduction in the number of circuits being clocked constitutes lower consumed power. PIC24H devices can manage power consumption in four different ways:

- Clock frequency
- · Instruction-based Sleep and Idle modes
- · Software-controlled Doze mode
- · Selective peripheral control in software

Combinations of these methods can be used to selectively tailor an application's power consumption while still maintaining critical application features, such as timing-sensitive communications.

# 9.1 Clock Frequency and Clock Switching

PIC24H devices allow a wide range of clock frequencies to be selected under application control. If the system clock configuration is not locked, users can choose low-power or high-precision oscillators by simply changing the NOSC bits (OSCCON<10:8>). The process of changing a system clock during operation, as well as limitations to the process, are discussed in more detail in **Section 8.0 "Oscillator Configuration"**.

### 9.2 Instruction-Based Power-Saving

PIC24H devices have two special power-saving modes that are entered through the execution of a special PWRSAV instruction. Sleep mode stops clock operation

and halts all code execution. Idle mode halts the CPU and code execution, but allows peripheral modules to continue operation. The assembly syntax of the PWRSAV instruction is shown in Example 9-1.

**Note:** SLEEP\_MODE and IDLE\_MODE are constants defined in the assembler include file for the selected device.

Sleep and Idle modes can be exited as a result of an enabled interrupt, WDT time-out or a device Reset. When the device exits these modes, it is said to "wake-up".

### 9.2.1 SLEEP MODE

Sleep mode has these features:

- The system clock source is shut down. If an on-chip oscillator is used, it is turned off.
- The device current consumption is reduced to a minimum, provided that no I/O pin is sourcing current.
- The Fail-Safe Clock Monitor does not operate during Sleep mode since the system clock source is disabled.
- The LPRC clock continues to run in Sleep mode if the WDT is enabled.
- The WDT, if enabled, is automatically cleared prior to entering Sleep mode.
- Some device features or peripherals may continue to operate in Sleep mode. This includes items such as the input change notification on the I/O ports, or peripherals that use an external clock input. Any peripheral that requires the system clock source for its operation is disabled in Sleep mode.

The device will wake-up from Sleep mode on any of the these events:

- Any interrupt source that is individually enabled.
- Any form of device Reset.
- A WDT time-out.

On wake-up from Sleep, the processor restarts with the same clock source that was active when Sleep mode was entered.

### **EXAMPLE 9-1:** PWRSAV INSTRUCTION SYNTAX

PWRSAV #SLEEP\_MODE ; Put the device into SLEEP mode PWRSAV #IDLE\_MODE ; Put the device into IDLE mode

#### 9.2.2 IDLE MODE

Idle mode has these features:

- The CPU stops executing instructions.
- The WDT is automatically cleared.
- The system clock source remains active. By default, all peripheral modules continue to operate normally from the system clock source, but can also be selectively disabled (see Section 9.4 "Peripheral Module Disable").
- If the WDT or FSCM is enabled, the LPRC also remains active.

The device will wake from Idle mode on any of these events:

- · Any interrupt that is individually enabled.
- · Any device Reset.
- · A WDT time-out.

On wake-up from Idle, the clock is reapplied to the CPU and instruction execution begins immediately, starting with the instruction following the PWRSAV instruction, or the first instruction in the ISR.

## 9.2.3 INTERRUPTS COINCIDENT WITH POWER SAVE INSTRUCTIONS

Any interrupt that coincides with the execution of a PWRSAV instruction is held off until entry into Sleep or Idle mode has completed. The device then wakes up from Sleep or Idle mode.

### 9.3 Doze Mode

Generally, changing clock speed and invoking one of the power-saving modes are the preferred strategies for reducing power consumption. There may be circumstances, however, where this is not practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed may introduce communication errors, while using a power-saving mode may stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default setting.

It is also possible to use Doze mode to selectively reduce power consumption in event-driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption while the CPU idles, waiting for something to invoke an interrupt routine. Enabling the automatic return to full-speed CPU operation on interrupts is enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

For example, suppose the device is operating at 20 MIPS and the CAN module has been configured for 500 kbps based on this device operating speed. If the device is now placed in Doze mode with a clock frequency ratio of 1:4, the CAN module continues to communicate at the required bit rate of 500 kbps, but the CPU now starts executing instructions at a frequency of 5 MIPS.

### 9.4 Peripheral Module Disable

The Peripheral Module Disable (PMD) registers provide a method to disable a peripheral module by stopping all clock sources supplied to that module. When a peripheral is disabled via the appropriate PMD control bit, the peripheral is in a minimum power consumption state. The control and status registers associated with the peripheral are also disabled, so writes to those registers will have no effect and read values will be invalid.

A peripheral module is only enabled if both the associated bit in the PMD register is cleared and the peripheral is supported by the specific dsPIC® DSC variant. If the peripheral is present in the device, it is enabled in the PMD register by default.

Note:

If a PMD bit is set, the corresponding module is disabled after a delay of 1 instruction cycle. Similarly, if a PMD bit is cleared, the corresponding module is enabled after a delay of 1 instruction cycle (assuming the module control registers are already configured to enable module operation).

### 10.0 I/O PORTS

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

All of the device pins (except VDD, VSS, MCLR and OSC1/CLKIN) are shared between the peripherals and the parallel I/O ports. All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

### 10.1 Parallel I/O (PIO) Ports

A parallel I/O port that shares a pin with a peripheral is, in general, subservient to the peripheral. The peripheral's output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pin. The logic also prevents "loop through", in which a port's digital output can drive the input of a peripheral that shares the same pin. Figure 10-1 shows how ports are shared with other peripherals and the associated I/O pin to which they are connected.

When a peripheral is enabled and actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin may be read, but the output driver for the parallel port bit will be disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin may be driven by a port.

All port pins have three registers directly associated with their operation as digital I/O. The data direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx), read the latch. Writes to the latch, write the latch. Reads from the port (PORTx), read the port pins, while writes to the port pins, write the latch.

Any bit and its associated data and control registers that are not valid for a particular device will be disabled. That means the corresponding LATx and TRISx registers and the port pins will read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs. An example is the INT4 pin.

**Note:** The voltage on a digital input pin can be between -0.3V to 5.6V.

FIGURE 10-1: BLOCK DIAGRAM OF A TYPICAL SHARED PORT STRUCTURE

### 10.2 Open-Drain Configuration

In addition to the PORT, LAT and TRIS registers for data control, each port pin can also be individually configured for either digital or open-drain output. This is controlled by the Open-Drain Control register, ODCx, associated with each port. Setting any of the bits configures the corresponding pin to act as an open-drain output.

The open-drain feature allows the generation of outputs higher than VDD (e.g., 5V) on any desired digital only pins by using external pull-up resistors. (The open-drain I/O feature is not supported on pins that have analog functionality multiplexed on the pin.) The maximum open-drain voltage allowed is the same as the maximum VIH specification. The open-drain output feature is supported for both port pin and peripheral configurations.

### 10.3 Configuring Analog Port Pins

The use of the ADxPCFGH, ADxPCFGL and TRIS registers control the operation of the A/D port pins. The port pins that are desired as analog inputs must have their corresponding TRIS bit set (input). If the TRIS bit is cleared (output), the digital output level (VOH or VOL) is converted.

Clearing any bit in the ADxPCFGH or ADxPCFGL register configures the corresponding bit to be an analog pin. This is also the Reset state of any I/O pin that has an analog (ANx) function associated with it.

Note: In devices with two A/D modules, if the corresponding PCFG bit in either AD1PCFGH(L) and AD2PCFGH(L) is cleared, the pin is configured as an analog input.

When reading the PORT register, all pins configured as analog input channels will read as cleared (a low level).

Pins configured as digital inputs will not convert an analog input. Analog levels on any pin that is defined as a digital input (including the ANx pins) can cause the input buffer to consume current that exceeds the device specifications.

**Note:** The voltage on an analog input pin can be between -0.3V to (VDD + 0.3 V).

### 10.4 I/O Port Write/Read Timing

One instruction cycle is required between a port direction change or port write operation and a read operation of the same port. Typically, this instruction would be a  $\mathtt{NOP}$ .

### 10.5 Input Change Notification

The input change notification function of the I/O ports allows the PIC24H devices to generate interrupt requests to the processor in response to a change-of-state on selected input pins. This feature is capable of detecting input change-of-states even in Sleep mode, when the clocks are disabled. Depending on the device pin count, there are up to 24 external signals (CN0 through CN23) that can be selected (enabled) for generating an interrupt request on a change-of-state.

There are four control registers associated with the CN module. The CNEN1 and CNEN2 registers contain the CN interrupt enable (CNxIE) control bits for each of the CN input pins. Setting any of these bits enables a CN interrupt for the corresponding pins.

Each CN pin also has a weak pull-up connected to it. The pull-ups act as a current source that is connected to the pin and eliminate the need for external resistors when push button or keypad devices are connected. The pull-ups are enabled separately using the CNPU1 and CNPU2 registers, which contain the weak pull-up enable (CNxPUE) bits for each of the CN pins. Setting any of the control bits enables the weak pull-ups for the corresponding pins.

**Note:** Pull-ups on change notification pins should always be disabled whenever the port pin is configured as a digital output.

### **EXAMPLE 10-1: PORT WRITE/READ EXAMPLE**

```
MOV 0xFF00, W0 ; Configure PORTB<15:8> as inputs
MOV W0, TRISBB ; and PORTB<7:0> as outputs
NOP ; Delay 1 cycle
btss PORTB, #13 ; Next Instruction
```

### 11.0 TIMER1

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The Timer1 module is a 16-bit timer, which can serve as the time counter for the real-time clock, or operate as a free-running interval timer/counter. Timer1 can operate in three modes:

- 16-bit Timer
- 16-bit Synchronous Counter
- 16-bit Asynchronous Counter

Timer1 also supports these features:

- · Timer gate operation
- Selectable prescaler settings
- Timer operation during CPU Idle and Sleep modes
- Interrupt on 16-bit Period register match or falling edge of external gate signal

Figure 11-1 presents a block diagram of the 16-bit timer module.

To configure Timer1 for operation:

- 1. Set the TON bit (= 1) in the T1CON register.
- 2. Select the timer prescaler ratio using the TCKPS<1:0> bits in the T1CON register.
- 3. Set the Clock and Gating modes using the TCS and TGATE bits in the T1CON register.
- 4. Set or clear the TSYNC bit in T1CON to select synchronous or asynchronous operation.
- Load the timer period value into the PR1 register.
- 6. If interrupts are required, set the interrupt enable bit, T1IE. Use the priority bits, T1IP<2:0>, to set the interrupt priority.

FIGURE 11-1: 16-BIT TIMER1 MODULE BLOCK DIAGRAM

# 12.0 TIMER2/3, TIMER4/5, TIMER6/7 AND TIMER8/9

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The Timer2/3, Timer4/5, Timer6/7 and Timer8/9 modules are 32-bit timers, which can also be configured as four independent 16-bit timers with selectable operating modes.

As a 32-bit timer, Timer2/3, Timer4/5, Timer6/7 and Timer8/9 operate in three modes:

- Two Independent 16-bit Timers (e.g., Timer2 and Timer3) with all 16-bit operating modes (except Asynchronous Counter mode)
- Single 32-bit Timer
- Single 32-bit Synchronous Counter

They also support these features:

- Timer Gate Operation
- Selectable Prescaler Settings
- Timer Operation during Idle and Sleep modes
- Interrupt on a 32-bit Period Register Match
- Time Base for Input Capture and Output Compare Modules (Timer2 and Timer3 only)
- ADC1 Event Trigger (Timer2/3 only)
- ADC2 Event Trigger (Timer4/5 only)

Individually, all eight of the 16-bit timers can function as synchronous timers or counters. They also offer the features listed above, except for the event trigger; this is implemented only with Timer2/3. The operating modes and enabled features are determined by setting the appropriate bit(s) in the T2CON, T3CON, T4CON, T5CON, T6CON, T7CON, T8CON and T9CON registers. T2CON, T4CON, T6CON and T8CON are shown in generic form in Register 12-1. T3CON, T5CON, T7CON and T9CON are shown in Register 12-2.

For 32-bit timer/counter operation, Timer2, Timer4, Timer6 or Timer8 is the least significant word; Timer3, Timer5, Timer7 or Timer9 is the most significant word of the 32-bit timers.

Note:

For 32-bit operation, T3CON, T5CON, T7CON and T9CON control bits are ignored. Only T2CON, T4CON, T6CON and T8CON control bits are used for setup and control. Timer2, Timer4, Timer6 and Timer8 clock and gate inputs are utilized for the 32-bit timer modules, but an interrupt is generated with the Timer3, Timer5, Ttimer7 and Timer9 interrupt flags.

To configure Timer2/3, Timer4/5, Timer6/7 or Timer8/9 for 32-bit operation:

- 1. Set the corresponding T32 control bit.
- Select the prescaler ratio for Timer2, Timer4, Timer6 or Timer8 using the TCKPS<1:0> bits.
- 3. Set the Clock and Gating modes using the corresponding TCS and TGATE bits.
- 4. Load the timer period value. PR3, PR5, PR7 or PR9 contains the most significant word of the value, while PR2, PR4, PR6 or PR8 contains the least significant word.
- If interrupts are required, set the interrupt enable bit, T3IE, T5IE, T7IE or T9IE. Use the priority bits, T3IP<2:0>, T5IP<2:0>, T7IP<2:0> or T9IP<2:0>, to set the interrupt priority. While Timer2, Timer4, Timer6 or Timer8 control the timer, the interrupt appears as a Timer3, Timer5, Timer7 or Timer9 interrupt.
- 6. Set the corresponding TON bit.

The timer value at any point is stored in the register pair, TMR3:TMR2, TMR5:TMR4, TMR7:TMR6 or TMR9:TMR8. TMR3, TMR5, TMR7 or TMR9 always contains the most significant word of the count, while TMR2, TMR4, TMR6 or TMR8 contains the least significant word.

To configure any of the timers for individual 16-bit operation:

- 1. Clear the T32 bit corresponding to that timer.
- 2. Select the timer prescaler ratio using the TCKPS<1:0> bits.
- Set the Clock and Gating modes using the TCS and TGATE bits.
- 4. Load the timer period value into the PRx register.
- If interrupts are required, set the interrupt enable bit, TxIE. Use the priority bits, TxIP<2:0>, to set the interrupt priority.
- 6. Set the TON bit.

A block diagram for a 32-bit timer pair (Timer4/5) example is shown in Figure 12-1 and a timer (Timer4) operating in 16-bit mode example is shown in Figure 12-2.

**Note:** Only Timer2 and Timer3 can trigger a DMA data transfer.

NOTES:

#### 13.0 INPUT CAPTURE

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The input capture module is useful in applications requiring frequency (period) and pulse measurement. The PIC24H devices support up to eight input capture channels.

The input capture module captures the 16-bit value of the selected Time Base register when an event occurs at the ICx pin. The events that cause a capture event are listed below in three categories:

- 1. Simple Capture Event modes
  - -Capture timer value on every falling edge of input at ICx pin
  - -Capture timer value on every rising edge of input at ICx pin
- Capture timer value on every edge (rising and falling)
- 3. Prescaler Capture Event modes
  - -Capture timer value on every 4th rising edge of input at ICx pin
  - -Capture timer value on every 16th rising edge of input at ICx pin

Each input capture channel can select between one of two 16-bit timers (Timer2 or Timer3) for the time base. The selected timer can use either an internal or external clock.

Other operational features include:

- Device wake-up from capture pin during CPU Sleep and Idle modes
- · Interrupt on input capture event
- 4-word FIFO buffer for capture values
  - Interrupt optionally generated after 1, 2, 3 or 4 buffer locations are filled
- Input capture can also be used to provide additional sources of external interrupts

Note: Only IC1 and IC2 can trigger a DMA data transfer. If DMA data transfers are required, the FIFO buffer size must be set to 1 (ICI<1:0> = 00).

### 14.0 OUTPUT COMPARE

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

# 14.1 Setup for Single Output Pulse Generation

When the OCM control bits (OCxCON<2:0>) are set to '100', the selected output compare channel initializes the OCx pin to the low state and generates a single output pulse.

To generate a single output pulse, the following steps are required (these steps assume timer source is initially turned off but this is not a requirement for the module operation):

- Determine the instruction clock cycle time. Take into account the frequency of the external clock to the timer source (if one is used) and the timer prescaler settings.
- Calculate time to the rising edge of the output pulse relative to the TMRy start value (0000h).
- 3. Calculate the time to the falling edge of the pulse based on the desired pulse width and the time to the rising edge of the pulse.
- Write the values computed in steps 2 and 3 above into the Output Compare register, OCxR, and the Output Compare Secondary register, OCxRS, respectively.
- Set Timer Period register, PRy, to value equal to or greater than value in OCxRS, the Output Compare Secondary register.
- Set the OCM bits to '100' and the OCTSEL (OCxCON<3>) bit to the desired timer source. The OCx pin state will now be driven low.
- 7. Set the TON (TyCON<15>) bit to '1', which enables the compare time base to count.
- Upon the first match between TMRy and OCxR, the OCx pin will be driven high.
- 9. When the incrementing timer, TMRy, matches the Output Compare Secondary register, OCxRS, the second and trailing edge (high-to-low) of the pulse is driven onto the OCx pin. No additional pulses are driven onto the OCx pin and it remains at low. As a result of the second compare match event, the OCxIF interrupt flag bit is set, which will result in an interrupt if it is enabled, by setting the OCxIE bit. For further information on peripheral interrupts, refer to Section 6.0 "Interrupt Controller".
- 10. To initiate another single pulse output, change the Timer and Compare register settings, if needed, and then issue a write to set the OCM bits to '100'. Disabling and re-enabling of the timer, and clearing the TMRy register, are not required but may be advantageous for defining a pulse from a known event time boundary.

The output compare module does not have to be disabled after the falling edge of the output pulse. Another pulse can be initiated by rewriting the value of the OCxCON register.

# 14.2 Setup for Continuous Output Pulse Generation

When the OCM control bits (OCxCON<2:0>) are set to '101', the selected output compare channel initializes the OCx pin to the low state and generates output pulses on each and every compare match event.

For the user to configure the module for the generation of a continuous stream of output pulses, the following steps are required (these steps assume timer source is initially turned off but this is not a requirement for the module operation):

- Determine the instruction clock cycle time. Take into account the frequency of the external clock to the timer source (if one is used) and the timer prescaler settings.
- Calculate time to the rising edge of the output pulse relative to the TMRy start value (0000h).
- Calculate the time to the falling edge of the pulse, based on the desired pulse width and the time to the rising edge of the pulse.
- Write the values computed in step 2 and 3 above into the Output Compare register, OCxR, and the Output Compare Secondary register, OCxRS, respectively.
- Set Timer Period register, PRy, to value equal to or greater than value in OCxRS, the Output Compare Secondary register.
- Set the OCM bits to '101' and the OCTSEL bit to the desired timer source. The OCx pin state will now be driven low.
- 7. Enable the compare time base by setting the TON (TyCON<15>) bit to '1'.
- 8. Upon the first match between TMRy and OCxR, the OCx pin will be driven high.
- When the compare time base, TMRy, matches the Output Compare Secondary register, OCxRS, the second and trailing edge (high-to-low) of the pulse is driven onto the OCx pin.
- 10. As a result of the second compare match event, the OCxIF interrupt flag bit set.
- When the compare time base and the value in its respective Timer Period register match, the TMRy register resets to 0x0000 and resumes counting.
- Steps 8 through 11 are repeated and a continuous stream of pulses is generated, indefinitely.
   The OCxIF flag is set on each OCxRS-TMRy compare match event.

#### 14.3 Pulse-Width Modulation Mode

The following steps should be taken when configuring the output compare module for PWM operation:

- Set the PWM period by writing to the selected Timer Period register (PRy).
- Set the PWM duty cycle by writing to the OCxRS register.
- 3. Write the OxCR register with the initial duty cycle.
- 4. Enable interrupts, if required, for the timer and output compare modules. The output compare interrupt is required for PWM Fault pin utilization.
- Configure the output compare module for one of two PWM operation modes by writing to the Output Compare Mode bits, OCM<2:0> (OCxCON<2:0>).
- Set the TMRy prescale value and enable the time base by setting TON = 1 (TxCON<15>).

Note: The OCxR register should be initialized before the output compare module is first enabled. The OCxR register becomes a read-only duty cycle register when the module is operated in the PWM modes. The value held in OCxR will become the PWM duty cycle for the first PWM period. The contents of the Output Compare Secondary register, OCxRS, will not be transferred into OCxR until a time base period match occurs.

#### 14.3.1 PWM PERIOD

The PWM period is specified by writing to PRy, the Timer Period register. The PWM period can be calculated using Equation 14-1:

# EQUATION 14-1: CALCULATING THE PWM PERIOD

PWM Period = [(PRy) + 1] • TCY • (Timer Prescale Value) where:
PWM Frequency = 1/[PWM Period]

Note: A PRy value of N will produce a PWM period of N + 1 time base count cycles. For example, a value of 7 written into the PRy register will yield a period consisting of eight time base cycles.

#### 14.3.2 PWM DUTY CYCLE

The PWM duty cycle is specified by writing to the OCxRS register. The OCxRS register can be written to at any time, but the duty cycle value is not latched into OCxR until a match between PRy and TMRy occurs (i.e., the period is complete). This provides a double buffer for the PWM duty cycle and is essential for glitchless PWM operation. In the PWM mode, OCxR is a read-only register.

Some important boundary parameters of the PWM duty cycle include:

- If the Output Compare register, OCxR, is loaded with 0000h, the OCx pin will remain low (0% duty cycle).
- If OCxR is greater than PRy (Timer Period register), the pin will remain high (100% duty cycle).
- If OCxR is equal to PRy, the OCx pin will be low for one time base count value and high for all other count values.

See Example 14-1 for PWM mode timing details. Table 14-1 shows example PWM frequencies and resolutions for a device operating at 10 MIPS.

### **EQUATION 14-2: CALCULATION FOR MAXIMUM PWM RESOLUTION**

Maximum PWM Resolution (bits) = 
$$\frac{\log_{10} \left(\frac{FCY}{FPWM}\right)}{\log_{10}(2)}$$
 bits

### **EXAMPLE 14-1: PWM PERIOD AND DUTY CYCLE CALCULATIONS**

1. Find the Timer Period register value for a desired PWM frequency that is 52.08 kHz, where FCY = 16 MHz and a Timer2 prescaler setting of 1:1.

TCY = 62.5 ns

PWM Period = 1/PWM Frequency = 1/52.08 kHz = 19.2 μs PWM Period = (PR2 + 1) • TCY • (Timer2 Prescale Value)

19.2  $\mu$ s = (PR2 + 1) • 62.5 ns • 1

PR2 = 306

2. Find the maximum resolution of the duty cycle that can be used with a 52.08 kHz frequency and a 32 MHz device clock rate:

PWM Resolution =  $log_{10}(FCY/FPWM)/log_{10}2)$  bits

=  $(\log_{10}(16 \text{ MHz}/52.08 \text{ kHz})/\log_{10}2) \text{ bits}$ 

= 8.3 bits

1 = Output Compare x will halt in CPU Idle mode

0 = Output Compare x will continue to operate in CPU Idle mode

bit 12-5 Unimplemented: Read as '0'

bit 4 OCFLT: PWM Fault Condition Status bit

1 = PWM Fault condition has occurred (cleared in HW only)

0 = No PWM Fault condition has occurred (This bit is only used when OCM<2:0> = 111.)

bit 3 OCTSEL: Output Compare Timer Select bit<sup>(1)</sup>

1 = Timer3 is the clock source for Compare x0 = Timer2 is the clock source for Compare x

bit 2-0 OCM<2:0>: Output Compare Mode Select bits

111 = PWM mode on OCx, Fault pin enabled

110 = PWM mode on OCx, Fault pin disabled

101 = Initialize OCx pin low, generate continuous output pulses on OCx pin

100 = Initialize OCx pin low, generate single output pulse on OCx pin

011 = Compare event toggles OCx pin

010 = Initialize OCx pin high, compare event forces OCx pin low

001 = Initialize OCx pin low, compare event forces OCx pin high

000 = Output compare channel is disabled

Note 1: Refer to the device data sheet for specific time bases available to the output compare module.

# 15.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices may be serial EEPROMs, shift registers, display drivers, A/D converters, etc. The SPI module is compatible with SPI and SIOP from Motorola<sup>®</sup>.

Note:

In this section, the SPI modules are referred to together as SPIx, or separately as SPI1 and SPI2. Special Function Registers will follow a similar notation. For example, SPIxCON refers to the control register for the SPI1 or SPI2 module.

## 15.1 Operating Function Description

Each SPI module consists of a 16-bit shift register, SPIxSR (where x = 1 or 2), used for shifting data in and out, and a buffer register, SPIxBUF. A control register, SPIxCON, configures the module. Additionally, a status register, SPIxSTAT, indicates various status conditions.

The serial interface consists of 4 pins: SDIx (serial data input), SDOx (serial data output), SCKx (shift clock input or output), and SSx (active low slave select).

In Master mode operation, SCK is a clock output but in Slave mode, it is a clock input.

A series of eight (8) or sixteen (16) clock pulses shift out bits from the SPIxSR to SDOx pin and simultaneously shift in data from SDIx pin. An interrupt is generated when the transfer is complete and the corresponding interrupt flag bit (SPI1IF or SPI2IF) is set. This interrupt can be disabled through an interrupt enable bit (SPI1IE or SPI2IE).

The receive operation is double-buffered. When a complete byte is received, it is transferred from SPIxSR to SPIxBUF.

If the receive buffer is full when new data is being transferred from SPIxSR to SPIxBUF, the module will set the SPIROV bit indicating an overflow condition. The transfer of the data from SPIxSR to SPIxBUF will not be completed and the new data will be lost. The module will not respond to SCL transitions while SPIROV is '1', effectively disabling the module until SPIxBUF is read by user software.

Transmit writes are also double-buffered. The user writes to SPIxBUF. When the master or slave transfer is completed, the contents of the shift register (SPIxSR)

are moved to the receive buffer. If any transmit data has been written to the buffer register, the contents of the transmit buffer are moved to SPIxSR. The received data is thus placed in SPIxBUF and the transmit data in SPIxSR is ready for the next transfer.

Note: Both the transmit buffer (SPIxTXB) and the receive buffer (SPIxRXB) are mapped to the same register address, SPIxBUF.

**Note:** Do not perform read-modify-write operations (such as bit-oriented instructions) on the SPIxBUF register.

The module supports a basic framed SPI protocol while operating in either Master or Slave mode. A total of four framed SPI configurations are supported.

The SPI serial interface consists of four pins:

- SDIx: Serial Data Input
- · SDOx: Serial Data Output
- · SCKx: Shift Clock Input or Output
- SSx: Active-Low Slave Select or Frame Synchronization I/O Pulse

The SPI module can be configured to operate using 2, 3 or 4 pins. In the 3-pin mode,  $\overline{SSx}$  is not used. In the 2-pin mode, both SDOx and  $\overline{SSx}$  are not used.

A block diagram of an SPI module is shown in Figure 15-1. All PIC24H devices contain two SPI modules on a single device.

The SPI module contains an 8-word deep FIFO buffer; the top of the buffer is denoted as SPIxBUF. If DMA transfers are enabled, the FIFO buffer must be disabled by clearing the ENHBUF bit (SPIxCON2<0>).

To set up the SPI module for the Master mode of operation:

- 1. If using interrupts:
  - Clear the SPIxIF bit in the respective IFSn register.
  - b) Set the SPIxIE bit in the respective IECn register.
  - c) Write the SPIxIP bits in the respective IPCn register to set the interrupt priority.
- 2. Write the desired settings to the SPIxCON register with MSTEN (SPIxCON1<5>) = 1.
- 3. Clear the SPIROV bit (SPIxSTAT<6>).
- Enable SPI operation by setting the SPIEN bit (SPIxSTAT<15>).
- Write the data to be transmitted to the SPIxBUF register. Transmission (and reception) will start as soon as data is written to the SPIxBUF register.

# PIC24H

To set up the SPI module for the Slave mode of operation:

- 1. Clear the SPIxBUF register.
- 2. If using interrupts:
  - Clear the SPIxIF bit in the respective IFSn register.
  - Set the SPIxIE bit in the respective IECn register.
  - Write the SPIxIP bits in the respective IPCn register to set the interrupt priority.
- Write the desired settings to the SPIxCON1 and SPIxCON2 registers with MSTEN (SPIxCON1<5>) = 0.
- 4. Clear the SMP bit.

- If the CKE bit is set, then the SSEN bit (SPIxCON1<7>) must be set to enable the SSx pin.
- 6. Clear the SPIROV bit (SPIxSTAT<6>).
- Enable SPI operation by setting the SPIEN bit (SPIxSTAT<15>).

The SPI module generates an interrupt indicating completion of a byte or word transfer, as well as a separate interrupt for all SPI error conditions.

data transfer. If SPI1 or SPI2 is selected as the DMA IRQ source, a DMA transfer occurs when the SPI1IF or SPI2IF bit gets set as a result of an SPI1 or SPI2 byte or word transfer.

0 = Frame sync pulse precedes first bit clock

bit 0 **Unimplemented:** Read as '0'

This bit must not be set to '1' by the user application.

NOTES:

# 16.0 INTER-INTEGRATED CIRCUIT (I<sup>2</sup>C)

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The Inter-Integrated Circuit (I<sup>2</sup>C) module provides complete hardware support for both Slave and Multi-Master modes of the I<sup>2</sup>C serial communication standard, with a 16-bit interface.

The PIC24H devices have up to two  $I^2C$  interface modules, denoted as I2C1 and I2C2. Each  $I^2C$  module has a 2-pin interface: the SCLx pin is clock and the SDAx pin is data.

Each  $I^2C$  module 'x' (x = 1 or 2) offers the following key features:

- I<sup>2</sup>C interface supporting both master and slave operation.
- I<sup>2</sup>C Slave mode supports 7 and 10-bit address.
- I<sup>2</sup>C Master mode supports 7 and 10-bit address.
- I<sup>2</sup>C port allows bidirectional transfers between master and slaves.
- Serial clock synchronization for I<sup>2</sup>C port can be used as a handshake mechanism to suspend and resume serial transfer (SCLREL control).
- I<sup>2</sup>C supports multi-master operation; detects bus collision and will arbitrate accordingly.

### 16.1 Operating Modes

The hardware fully implements all the master and slave functions of the I<sup>2</sup>C Standard and Fast mode specifications, as well as 7 and 10-bit addressing.

The I<sup>2</sup>C module can operate either as a slave or a master on an I<sup>2</sup>C bus.

The following types of I<sup>2</sup>C operation are supported:

- I<sup>2</sup>C slave operation with 7-bit address
- I<sup>2</sup>C slave operation with 10-bit address
- I<sup>2</sup>C master operation with 7 or 10-bit address

For details about the communication sequence in each of these modes, please refer to the "dsPIC30F Family Reference Manual" (DS70046).

# 16.2 I<sup>2</sup>C Registers

I2CxCON and I2CxSTAT are control and status registers, respectively. The I2CxCON register is readable and writable. The lower six bits of I2CxSTAT are read-only. The remaining bits of the I2CSTAT are read/write.

I2CxRSR is the shift register used for shifting data, whereas I2CxRCV is the buffer register to which data bytes are written, or from which data bytes are read. I2CxRCV is the receive buffer. I2CxTRN is the transmit register to which bytes are written during a transmit operation.

The I2CxADD register holds the slave address. A status bit, ADD10, indicates 10-bit Address mode. The I2CxBRG acts as the Baud Rate Generator (BRG) reload value.

In receive operations, I2CxRSR and I2CxRCV together form a double-buffered receiver. When I2CxRSR receives a complete byte, it is transferred to I2CxRCV and an interrupt pulse is generated.

# 16.3 I<sup>2</sup>C Interrupts

The I $^2$ C module generates two interrupt flags, MI2CxIF (I $^2$ C Master Events Interrupt Flag) and SI2CxIF (I $^2$ C Slave Events Interrupt Flag). A separate interrupt is generated for all I $^2$ C error conditions.

#### 16.4 Baud Rate Generator

In I<sup>2</sup>C Master mode, the reload value for the BRG is located in the I2CxBRG register. When the BRG is loaded with this value, the BRG counts down to '0' and stops until another reload has taken place. If clock arbitration is taking place, for instance, the BRG is reloaded when the SCLx pin is sampled high.

As per the I<sup>2</sup>C standard, FSCL may be 100 kHz or 400 kHz. However, the user can specify any baud rate up to 1 MHz. I2CxBRG values of '0' or '1' are illegal.

#### **EQUATION 16-1: SERIAL CLOCK RATE**

$$I2CxBRG = \left(\frac{FCY}{FSCL} - \frac{FCY}{1,111,111}\right) - 1$$

# 16.5 I<sup>2</sup>C Module Addresses

The I2CxADD register contains the Slave mode addresses. The register is a 10-bit register.

If the A10M bit (I2CxCON<10>) is '0', the address is interpreted by the module as a 7-bit address. When an address is received, it is compared to the 7 Least Significant bits of the I2CxADD register.

If the A10M bit is '1', the address is assumed to be a 10-bit address. When an address is received, it will be compared with the binary value, '11110 A9 A8' (where A9 and A8 are two Most Significant bits of I2CxADD). If that value matches, the next address will be compared with the Least Significant 8 bits of I2CxADD, as specified in the 10-bit addressing protocol.

TABLE 16-1: 7-BIT I<sup>2</sup>C™ SLAVE ADDRESSES SUPPORTED BY PIC24H

| 0x00      | General call address or Start byte       |
|-----------|--|
| 0x01-0x03 | Reserved                                 |
| 0x04-0x07 | Hs mode Master codes                     |
| 0x08-0x77 | Valid 7-bit addresses                    |
| 0x78-0x7b | Valid 10-bit addresses<br>(lower 7 bits) |
| 0x7c-0x7f | Reserved                                 |

#### 16.6 Slave Address Masking

The I2CxMSK register (Register 16-3) designates address bit positions as "don't care" for both 7-bit and 10-bit Address modes. Setting a particular bit location (= 1) in the I2CxMSK register, causes the slave module to respond, whether the corresponding address bit value is a '0' or '1'. For example, when I2CxMSK is set to '00100000', the slave module will detect both addresses, '0000000' and '00100000'.

To enable address masking, the Intelligent Peripheral Management Interface (IPMI) must be disabled by clearing the IPMIEN bit (I2CxCON<11>).

### 16.7 IPMI Support

The control bit, IPMIEN, enables the module to support the Intelligent Peripheral Management Interface (IPMI). When this bit is set, the module accepts and acts upon all addresses.

### 16.8 General Call Address Support

The general call address can address all devices. When this address is used, all devices should, in theory, respond with an Acknowledgement.

The general call address is one of eight addresses reserved for specific purposes by the  $I^2C$  protocol. It consists of all '0's with  $R_W = 0$ .

The general call address is recognized when the General Call Enable (GCEN) bit is set (I2CxCON<7>=1). When the interrupt is serviced, the source for the interrupt can be checked by reading the contents of the I2CxRCV to determine if the address was device-specific or a general call address.

#### 16.9 Automatic Clock Stretch

In Slave modes, the module can synchronize buffer reads and writes to the master device by clock stretching.

#### 16.9.1 TRANSMIT CLOCK STRETCHING

Both 10-bit and 7-bit Transmit modes implement clock stretching by asserting the SCLREL bit after the falling edge of the ninth clock, if the TBF bit is cleared, indicating the buffer is empty.

In Slave Transmit modes, clock stretching is always performed, irrespective of the STREN bit. The user's ISR must set the SCLREL bit before transmission is allowed to continue. By holding the SCLx line low, the user has time to service the ISR and load the contents of the I2CxTRN before the master device can initiate another transmit sequence.

### 16.9.2 RECEIVE CLOCK STRETCHING

The STREN bit in the I2CxCON register can be used to enable clock stretching in Slave Receive mode. When the STREN bit is set, the SCLx pin will be held low at the end of each data receive sequence.

The user's ISR must set the SCLREL bit before reception is allowed to continue. By holding the SCLx line low, the user has time to service the ISR and read the contents of the I2CxRCV before the master device can initiate another receive sequence. This will prevent buffer overruns from occurring.

# 16.10 Software Controlled Clock Stretching (STREN = 1)

When the STREN bit is '1', the SCLREL bit may be cleared by software to allow software to control the clock stretching.

If the STREN bit is '0', a software write to the SCLREL bit will be disregarded and have no effect on the SCLREL bit.

### 16.11 Slope Control

The I<sup>2</sup>C standard requires slope control on the SDAx and SCLx signals for Fast mode (400 kHz). The control bit, DISSLW, enables the user to disable slew rate control if desired. It is necessary to disable the slew rate control for 1 MHz mode.

#### 16.12 Clock Arbitration

Clock arbitration occurs when the master deasserts the SCLx pin (SCLx allowed to float high) during any receive, transmit or Restart/Stop condition. When the SCLx pin is allowed to float high, the Baud Rate Generator (BRG) is suspended from counting until the SCLx pin is actually sampled high. When the SCLx pin is sampled high, the Baud Rate Generator is reloaded with the contents of I2CxBRG and begins counting. This ensures that the SCLx high time will always be at least one BRG rollover count in the event that the clock is held low by an external device.

# 16.13 Multi-Master Communication, Bus Collision and Bus Arbitration

Multi-Master mode support is achieved by bus arbitration. When the master outputs address/data bits onto the SDAx pin, arbitration takes place when the master outputs a '1' on SDAx by letting SDAx float high while another master asserts a '0'. When the SCLx pin floats high, data should be stable. If the expected data on SDAx is a '1' and the data sampled on the SDAx pin = 0, then a bus collision has taken place. The master will set the  $I^2C$  master events interrupt flag and reset the master portion of the  $I^2C$  port to its Idle state.

#### REGISTER 16-1: I2CxCON: I2Cx CONTROL REGISTER

bit 15 I2CEN: I2Cx Enable bit

1 = Enables the I2Cx module and configures the SDAx and SCLx pins as serial port pins

0 =Disables the I2Cx module. All I<sup>2</sup>C pins are controlled by port functions.

bit 14 **Unimplemented:** Read as '0'

bit 13 I2CSIDL: Stop in Idle Mode bit

1 = Discontinue module operation when device enters an Idle mode

0 = Continue module operation in Idle mode

bit 12 **SCLREL:** SCLx Release Control bit (when operating as I<sup>2</sup>C slave)

1 = Release SCLx clock

0 = Hold SCLx clock low (clock stretch)

If STREN = 1:

Bit is R/W (i.e., software may write '0' to initiate stretch and write '1' to release clock). Hardware clear at beginning of slave transmission. Hardware clear at end of slave reception.

If STREN = 0:

Bit is R/S (i.e., software may only write '1' to release clock). Hardware clear at beginning of slave transmission.

bit 11 IPMIEN: Intelligent Peripheral Management Interface (IPMI) Enable bit

1 = IPMI mode is enabled; all addresses Acknowledged

0 = IPMI mode disabled

bit 10 A10M: 10-bit Slave Address bit

1 = I2CxADD is a 10-bit slave address

0 = I2CxADD is a 7-bit slave address

bit 9 DISSLW: Disable Slew Rate Control bit

1 = Slew rate control disabled

0 = Slew rate control enabled

bit 8 SMEN: SMBus Input Levels bit

1 = Enable I/O pin thresholds compliant with SMBus specification

0 = Disable SMBus input thresholds

bit 7 **GCEN:** General Call Enable bit (when operating as I<sup>2</sup>C slave)

1 = Enable interrupt when a general call address is received in the I2CxRSR

(module is enabled for reception)

0 = General call address disabled

bit 6 STREN: SCLx Clock Stretch Enable bit (when operating as I<sup>2</sup>C slave)

Used in conjunction with SCLREL bit.

1 = Enable software or receive clock stretching

0 = Disable software or receive clock stretching

### REGISTER 16-1: I2CxCON: I2Cx CONTROL REGISTER (CONTINUED)

bit 5 **ACKDT:** Acknowledge Data bit (when operating as I<sup>2</sup>C master, applicable during master receive)

Value that will be transmitted when the software initiates an Acknowledge sequence.

- 1 = Send NACK during Acknowledge
- 0 = Send ACK during Acknowledge

bit 4 ACKEN: Acknowledge Sequence Enable bit

(when operating as I<sup>2</sup>C master, applicable during master receive)

- 1 = Initiate Acknowledge sequence on SDAx and SCLx pins and transmit ACKDT data bit. Hardware clear at end of master Acknowledge sequence.
- 0 = Acknowledge sequence not in progress
- bit 3 **RCEN:** Receive Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Enables Receive mode for  $I^2C$ . Hardware clear at end of eighth bit of master receive data byte.
  - 0 = Receive sequence not in progress
- bit 2 **PEN:** Stop Condition Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Initiate Stop condition on SDAx and SCLx pins. Hardware clear at end of master Stop sequence.
  - 0 = Stop condition not in progress
- bit 1 RSEN: Repeated Start Condition Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Initiate Repeated Start condition on SDAx and SCLx pins. Hardware clear at end of master Repeated Start sequence.
  - 0 = Repeated Start condition not in progress
- bit 0 **SEN:** Start Condition Enable bit (when operating as I<sup>2</sup>C master)
  - 1 = Initiate Start condition on SDAx and SCLx pins. Hardware clear at end of master Start sequence.
  - 0 = Start condition not in progress

bit 15 ACKSTAT: Acknowledge Status bit

(when operating as I<sup>2</sup>C master, applicable to master transmit operation)

1 = NACK received from slave

0 = ACK received from slave

Hardware set or clear at end of slave Acknowledge.

bit 14 **TRSTAT:** Transmit Status bit (when operating as I<sup>2</sup>C master, applicable to master transmit operation)

1 = Master transmit is in progress (8 bits + ACK)

0 = Master transmit is not in progress

Hardware set at beginning of master transmission. Hardware clear at end of slave Acknowledge.

bit 13-11 **Unimplemented:** Read as '0'

bit 10 BCL: Master Bus Collision Detect bit

1 = A bus collision has been detected during a master operation

0 = No collision

Hardware set at detection of bus collision.

bit 9 GCSTAT: General Call Status bit

1 = General call address was received0 = General call address was not received

Hardware set when address matches general call address. Hardware clear at Stop detection.

bit 8 ADD10: 10-bit Address Status bit

1 = 10-bit address was matched

0 = 10-bit address was not matched

Hardware set at match of 2nd byte of matched 10-bit address. Hardware clear at Stop detection.

bit 7 IWCOL: Write Collision Detect bit

1 = An attempt to write the I2CxTRN register failed because the  $I^2$ C module is busy

0 = No collision

Hardware set at occurrence of write to I2CxTRN while busy (cleared by software).

bit 6 I2COV: Receive Overflow Flag bit

 ${\tt 1}$  = A byte was received while the I2CxRCV register is still holding the previous byte

0 = No overflow

Hardware set at attempt to transfer I2CxRSR to I2CxRCV (cleared by software).

bit 5 **D\_A:** Data/Address bit (when operating as I<sup>2</sup>C slave)

1 = Indicates that the last byte received was data

0 = Indicates that the last byte received was device address

Hardware clear at device address match. Hardware set by reception of slave byte.

bit 4 **P:** Stop bit

1 = Indicates that a Stop bit has been detected last

0 = Stop bit was not detected last

Hardware set or clear when Start, Repeated Start or Stop detected.

### REGISTER 16-2: I2CxSTAT: I2Cx STATUS REGISTER (CONTINUED)

bit 3 S: Start bit

1 = Indicates that a Start (or Repeated Start) bit has been detected last

0 = Start bit was not detected last

Hardware set or clear when Start, Repeated Start or Stop detected.

bit 2 **R\_W:** Read/Write Information bit (when operating as I<sup>2</sup>C slave)

1 = Read – indicates data transfer is output from slave
 0 = Write – indicates data transfer is input to slave

Hardware set or clear after reception of I<sup>2</sup>C device address byte.

bit 1 RBF: Receive Buffer Full Status bit

1 = Receive complete, I2CxRCV is full0 = Receive not complete, I2CxRCV is empty

Hardware set when I2CxRCV is written with received byte. Hardware clear when software

reads I2CxRCV.

bit 0 TBF: Transmit Buffer Full Status bit

1 = Transmit in progress, I2CxTRN is full 0 = Transmit complete, I2CxTRN is empty

Hardware set when software writes I2CxTRN. Hardware clear at completion of data transmission.

NOTES:

# 17.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note: This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The Universal Asynchronous Receiver Transmitter (UART) module is one of the serial I/O modules available in the PIC24H device family. The UART is a full-duplex asynchronous system that can communicate with peripheral devices, such as personal computers, LIN, RS-232 and RS-485 interfaces. The module also supports a hardware flow control option with the UxCTS and UxRTS pins and also includes an IrDA® encoder and decoder.

The primary features of the UART module are:

- Full-Duplex, 8 or 9-bit Data Transmission through the UxTX and UxRX pins
- Even, Odd or No Parity Options (for 8-bit data)
- · One or Two Stop bits
- Hardware Flow Control Option with UxCTS and UxRTS pins

- Fully Integrated Baud Rate Generator with 16-bit Prescaler
- Baud Rates Ranging from 1 Mbps to 15 bps at 16 MIPS
- 4-deep First-In-First-Out (FIFO) Transmit Data Buffer
- 4-Deep FIFO Receive Data Buffer
- Parity, Framing and Buffer Overrun Error Detection
- Support for 9-bit mode with Address Detect (9th bit = 1)
- Transmit and Receive Interrupts
- A Separate Interrupt for all UART Error Conditions
- · Loopback mode for Diagnostic Support
- · Support for Sync and Break Characters
- Supports Automatic Baud Rate Detection
- · IrDA Encoder and Decoder Logic
- 16x Baud Clock Output for IrDA Support

A simplified block diagram of the UART is shown in Figure 17-1. The UART module consists of the key important hardware elements:

- · Baud Rate Generator
- Asynchronous Transmitter
- · Asynchronous Receiver

### FIGURE 17-1: UART SIMPLIFIED BLOCK DIAGRAM

- **Note 1:** Both UART1 and UART2 can trigger a DMA data transfer. If U1TX, U1RX, U2TX or U2RX is selected as a DMA IRQ source, a DMA transfer occurs when the U1TXIF, U1RXIF, U2TXIF or U2RXIF bit gets set as a result of a UART1 or UART2 transmission or reception.
  - 2: If DMA transfers are required, the UART TX/RX FIFO buffer must be set to a size of 1 byte/word (i.e., UTXISEL<1:0> = 00 and URXISEL<1:0> = 00).

## 17.1 UART Baud Rate Generator (BRG)

The UART module includes a dedicated 16-bit Baud Rate Generator. The BRGx register controls the period of a free-running 16-bit timer. Equation 17-1 shows the formula for computation of the baud rate with BRGH = 0.

# EQUATION 17-1: UART BAUD RATE WITH BRGH = 0

Baud Rate = 
$$\frac{FCY}{16 \cdot (BRGx + 1)}$$

$$BRGx = \frac{FCY}{16 \cdot Baud Rate} - 1$$

**Note:** FCY denotes the instruction cycle clock frequency (Fosc/2).

Example 17-1 shows the calculation of the baud rate error for the following conditions:

- Fcy = 4 MHz
- Desired Baud Rate = 9600

The maximum baud rate (BRGH = 0) possible is Fcy/16 (for BRGx = 0), and the minimum baud rate possible is Fcy/(16 \* 65536).

Equation 17-2 shows the formula for computation of the baud rate with BRGH = 1.

# EQUATION 17-2: UART BAUD RATE WITH BRGH = 1

Baud Rate = 
$$\frac{FCY}{4 \cdot (BRGx + 1)}$$

$$BRGx = \frac{FCY}{4 \cdot Baud Rate} - 1$$

**Note:** FCY denotes the instruction cycle clock frequency (Fosc/2).

The maximum baud rate (BRGH = 1) possible is FCY/4 (for BRGx = 0), and the minimum baud rate possible is FCY/(4 \* 65536).

Writing a new value to the BRGx register causes the BRG timer to be reset (cleared). This ensures the BRG does not wait for a timer overflow before generating the new baud rate.

## **EXAMPLE 17-1:** BAUD RATE ERROR CALCULATION (BRGH = 0)

Desired Baud Rate = FCY/(16 (BRGx + 1))
Solving for BRGx Value:

BRGx = ((FCY/Desired Baud Rate)/16) - 1

BRGx = ((4000000/9600)/16) - 1

BRGx = 25

Calculated Baud Rate = 4000000/(16(25+1))

9615

Error = (Calculated Baud Rate – Desired Baud Rate)

Desired Baud Rate

(9615 – 9600)/9600

= 0.16%

### 17.2 Transmitting in 8-bit Data Mode

- 1. Set up the UART:
  - Write appropriate values for data, parity and Stop bits.
  - b) Write appropriate baud rate value to the BRGx register.
  - Set up transmit and receive interrupt enable and priority bits.
- 2. Enable the UART.
- 3. Set the UTXEN bit (causes a transmit interrupt).
- 4. Write data byte to lower byte of UxTXREG word. The value will be immediately transferred to the Transmit Shift Register (TSR) and the serial bit stream will start shifting out with the next rising edge of the baud clock.
- Alternately, the data byte may be transferred while UTXEN = 0, and then the user may set UTXEN. This will cause the serial bit stream to begin immediately because the baud clock will start from a cleared state.
- A transmit interrupt will be generated as per interrupt control bits, UTXISEL<1:0>.

### 17.3 Transmitting in 9-bit Data Mode

- 1. Set up the UART (as described in **Section 17.2** "**Transmitting in 8-bit Data Mode**").
- 2. Enable the UART.
- 3. Set the UTXEN bit (causes a transmit interrupt).
- 4. Write UxTXREG as a 16-bit value only.
- A word write to UxTXREG triggers the transfer of the 9-bit data to the TSR. Serial bit stream will start shifting out with the first rising edge of the baud clock.
- A transmit interrupt will be generated as per the setting of control bits, UTXISEL<1:0>.

# 17.4 Break and Sync Transmit Sequence

The following sequence will send a message frame header made up of a Break, followed by an auto-baud Sync byte.

- 1. Configure the UART for the desired mode.
- Set UTXEN and UTXBRK sets up the Break character.
- Load the UxTXREG register with a dummy character to initiate transmission (value is ignored).
- 4. Write 0x55 to UxTXREG loads Sync character into the transmit FIFO.
- After the Break has been sent, the UTXBRK bit is reset by hardware. The Sync character now transmits.

# 17.5 Receiving in 8-bit or 9-bit Data Mode

- 1. Set up the UART (as described in **Section 17.2** "**Transmitting in 8-bit Data Mode**").
- 2. Enable the UART.
- A receive interrupt will be generated when one or more data characters have been received as per interrupt control bits, URXISEL<1:0>.
- Read the OERR bit to determine if an overrun error has occurred. The OERR bit must be reset in software.
- 5. Read UxRXREG.

The act of reading the UxRXREG character will move the next character to the top of the receive FIFO, including a new set of PERR and FERR values.

# 17.6 Flow Control Using UxCTS and UxRTS Pins

UARTx Clear to Send (UxCTS) and Request to Send (UxRTS) are the two hardware controlled active-low pins that are associated with the UART module. These two pins allow the UART to operate in Simplex and Flow Control modes. They are implemented to control the transmission and the reception between the Data Terminal Equipment (DTE). The UEN<1:0> bits in the UxMODE register configures these pins.

#### 17.7 Infrared Support

The UART module provides two types of infrared UART support:

- IrDA clock output to support external IrDA encoder and decoder device (legacy module support)
- Full implementation of the IrDA encoder and decoder.

# 17.7.1 EXTERNAL IrDA SUPPORT – IrDA CLOCK OUTPUT

To support external IrDA encoder and decoder devices, the BCLK pin (same as the UxRTS pin) can be configured to generate the 16x baud clock. With UEN<1:0> = 11, the BCLK pin will output the 16x baud clock if the UART module is enabled; it can be used to support the IrDA codec chip.

# 17.7.2 BUILT-IN IrDA ENCODER AND DECODER

The UART has full implementation of the IrDA encoder and decoder as part of the UART module. The built-in IrDA encoder and decoder functionality is enabled using the IREN bit (UxMODE<12>). When enabled (IREN = 1), the receive pin (UxRX) acts as the input from the infrared receiver. The transmit pin (UxTX) acts as the output to the infrared transmitter.

- bit 8 **TRMT:** Transmit Shift Register Empty bit (read-only)
  - 1 = Transmit Shift Register is empty and transmit buffer is empty (the last transmission has completed)
  - 0 = Transmit Shift Register is not empty, a transmission is in progress or queued
- bit 7-6 URXISEL<1:0>: Receive Interrupt Mode Selection bits
  - 11 =Interrupt is set on UxRSR transfer making the receive buffer full (i.e., has 4 data characters)
  - 10 =Interrupt is set on UxRSR transfer making the receive buffer 3/4 full (i.e., has 3 data characters)
  - 0x =Interrupt is set when any character is received and transferred from the UxRSR to the receive buffer. Receive buffer has one or more characters.
- bit 5 ADDEN: Address Character Detect bit (bit 8 of received data = 1)
  - 1 = Address Detect mode enabled. If 9-bit mode is not selected, this does not take effect.
  - 0 = Address Detect mode disabled
- **Note 1:** Value of bit only affects the transmit properties of the module when the IrDA encoder is enabled (IREN = 1).

### REGISTER 17-2: UxSTA: UARTx STATUS AND CONTROL REGISTER (CONTINUED)

- bit 4 RIDLE: Receiver Idle bit (read-only)
  - 1 = Receiver is Idle
  - 0 = Receiver is active
- bit 3 **PERR:** Parity Error Status bit (read-only)
  - 1 = Parity error has been detected for the current character (character at the top of the receive FIFO)
  - 0 = Parity error has not been detected
- bit 2 FERR: Framing Error Status bit (read-only)
  - 1 = Framing error has been detected for the current character (character at the top of the receive FIFO)
  - 0 = Framing error has not been detected
- bit 1 OERR: Receive Buffer Overrun Error Status bit (read/clear only)
  - 1 = Receive buffer has overflowed
  - 0 = Receive buffer has not overflowed. Clearing a previously set OERR bit (1  $\rightarrow$  0 transition) will reset the receiver buffer and the UxRSR to the empty state.
- bit 0 **URXDA:** Receive Buffer Data Available bit (read-only)
  - 1 = Receive buffer has data, at least one more character can be read
  - 0 = Receive buffer is empty
- **Note 1:** Value of bit only affects the transmit properties of the module when the IrDA encoder is enabled (IREN = 1).

# PIC24H

NOTES:

#### 18.0 ENHANCED CAN MODULE

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

#### 18.1 Overview

The Enhanced Controller Area Network (ECAN) module is a serial interface, useful for communicating with other CAN modules or microcontroller devices. This interface/protocol was designed to allow communications within noisy environments. The PIC24H devices contain up to two ECAN modules.

The CAN module is a communication controller implementing the CAN 2.0 A/B protocol, as defined in the BOSCH specification. The module will support CAN 1.2, CAN 2.0A, CAN 2.0B Passive and CAN 2.0B Active versions of the protocol. The module implementation is a full CAN system. The CAN specification is not covered within this data sheet. The reader may refer to the BOSCH CAN specification for further details.

The module features are as follows:

- Implementation of the CAN protocol, CAN 1.2, CAN 2.0A and CAN 2.0B
- Standard and extended data frames
- 0-8 bytes data length
- Programmable bit rate up to 1 Mbit/sec
- Automatic response to remote transmission requests
- Up to 8 transmit buffers with application specified prioritization and abort capability (each buffer may contain up to 8 bytes of data)
- Up to 32 receive buffers (each buffer may contain up to 8 bytes of data)
- Up to 16 full (standard/extended identifier) acceptance filters
- · 3 full acceptance filter masks
- DeviceNet<sup>™</sup> addressing support
- Programmable wake-up functionality with integrated low-pass filter
- Programmable Loopback mode supports self-test operation
- Signaling via interrupt capabilities for all CAN receiver and transmitter error states
- · Programmable clock source
- Programmable link to input capture module (IC2 for both CAN1 and CAN2) for time-stamping and network synchronization
- Low-power Sleep and Idle mode

The CAN bus module consists of a protocol engine and message buffering/control. The CAN protocol engine handles all functions for receiving and transmitting messages on the CAN bus. Messages are transmitted by first loading the appropriate data registers. Status and errors can be checked by reading the appropriate registers. Any message detected on the CAN bus is checked for errors and then matched against filters to see if it should be received and stored in one of the receive registers.

# 18.2 Frame Types

The CAN module transmits various types of frames which include data messages, remote transmission requests and as other frames that are automatically generated for control purposes. The following frame types are supported:

• Standard Data Frame:

A standard data frame is generated by a node when the node wishes to transmit data. It includes an 11-bit standard identifier (SID) but not an 18-bit extended identifier (EID).

· Extended Data Frame:

An extended data frame is similar to a standard data frame but includes an extended identifier as well.

• Remote Frame:

It is possible for a destination node to request the data from the source. For this purpose, the destination node sends a remote frame with an identifier that matches the identifier of the required data frame. The appropriate data source node will then send a data frame as a response to this remote request.

• Error Frame:

An error frame is generated by any node that detects a bus error. An error frame consists of two fields: an error flag field and an error delimiter field.

Overload Frame:

An overload frame can be generated by a node as a result of two conditions. First, the node detects a dominant bit during interframe space which is an illegal condition. Second, due to internal conditions, the node is not yet able to start reception of the next message. A node may generate a maximum of 2 sequential overload frames to delay the start of the next message.

· Interframe Space:

Interframe space separates a proceeding frame (of whatever type) from a following data or remote frame.

FIGURE 18-1: ECAN™ MODULE BLOCK DIAGRAM

#### 18.3 Modes of Operation

The CAN module can operate in one of several operation modes selected by the user. These modes include:

- Initialization Mode
- Disable Mode
- · Normal Operation Mode
- · Listen Only Mode
- · Listen All Messages Mode
- · Loopback Mode

Modes are requested by setting the REQOP<2:0> bits (CiCTRL1<10:8>). Entry into a mode is Acknowledged by monitoring the OPMODE<2:0> bits (CiCTRL1<7:5>). The module will not change the mode and the OPMODE bits until a change in mode is acceptable, generally during bus Idle time, which is defined as at least 11 consecutive recessive bits.

#### 18.3.1 INITIALIZATION MODE

In the Initialization mode, the module will not transmit or receive. The error counters are cleared and the interrupt flags remain unchanged. The programmer will have access to Configuration registers that are access restricted in other modes. The module will protect the user from accidentally violating the CAN protocol through programming errors. All registers which control the configuration of the module can not be modified while the module is on-line. The CAN module will not be allowed to enter the Configuration mode while a transmission is taking place. The Configuration mode serves as a lock to protect the following registers.

- All Module Control Registers
- · Baud Rate and Interrupt Configuration Registers
- · Bus Timing Registers
- Identifier Acceptance Filter Registers
- · Identifier Acceptance Mask Registers

#### 18.3.2 DISABLE MODE

In Disable mode, the module will not transmit or receive. The module has the ability to set the WAKIF bit due to bus activity, however, any pending interrupts will remain and the error counters will retain their value.

If the REQOP<2:0> bits (CiCTRL1<10:8>) = 001, the module will enter the Module Disable mode. If the module is active, the module will wait for 11 recessive bits on the CAN bus, detect that condition as an Idle bus, then accept the module disable command. When the OPMODE<2:0> bits (CiCTRL1<7:5>) = 001, that indicates whether the module successfully went into Module Disable mode. The I/O pins will revert to normal I/O function when the module is in the Module Disable mode.

The module can be programmed to apply a low-pass filter function to the CiRX input line while the module or the CPU is in Sleep mode. The WAKFIL bit (CiCFG2<14>) enables or disables the filter.

Note: Typically, if the CAN module is allowed to transmit in a particular mode of operation and a transmission is requested immediately after the CAN module has been placed in that mode of operation, the module waits for 11 consecutive recessive bits on the bus before starting transmission. If the user switches to Disable mode within

this 11-bit period, then this transmission is

aborted and the corresponding TXABT bit

#### 18.3.3 NORMAL OPERATION MODE

Normal Operation mode is selected when REQOP<2:0> = 000. In this mode, the module is activated and the I/O pins will assume the CAN bus functions. The module will transmit and receive CAN bus messages via the CiTX and CiRX pins.

is set and TXREQ bit is cleared.

#### 18.3.4 LISTEN ONLY MODE

If the Listen Only mode is activated, the module on the CAN bus is passive. The transmitter buffers revert to the port I/O function. The receive pins remain inputs. For the receiver, no error flags or Acknowledge signals are sent. The error counters are deactivated in this state. The Listen Only mode can be used for detecting the baud rate on the CAN bus. To use this, it is necessary that there are at least two further nodes that communicate with each other.

#### 18.3.5 LISTEN ALL MESSAGES MODE

The module can be set to ignore all errors and receive any message. The Listen All Messages mode is activated by setting REQOP<2:0> = '111'. In this mode, the data which is in the message assembly buffer, until the time an error occurred, is copied in the receive buffer and can be read via the CPU interface.

#### 18.3.6 LOOPBACK MODE

If the Loopback mode is activated, the module will connect the internal transmit signal to the internal receive signal at the module boundary. The transmit and receive pins revert to their port I/O function.

#### 18.4 Message Reception

#### 18.4.1 RECEIVE BUFFERS

The CAN bus module has up to 32 receive buffers, located in DMA RAM. The first 8 buffers need to be configured as receive buffers by clearing the corresponding TX/RX buffer selection (TXENn) bit in a CiTRmnCON register. The overall size of the CAN buffer area in DMA RAM is selectable by the user and is defined by the DMABS<2:0> bits (CiFCTRL<15:13>). The first 16 buffers can be assigned to receive filters, while the rest can be used only as a FIFO buffer.

### PIC24H

An additional buffer is always committed to monitoring the bus for incoming messages. This buffer is called the Message Assembly Buffer (MAB).

All messages are assembled by the MAB and are transferred to the buffers only if the acceptance filter criterion are met. When a message is received, the RBIF flag (CilNTF<1>) will be set. The user would then need to inspect the CiVEC and/or CiRXFUL1 register to determine which filter and buffer caused the interrupt to get generated. The RBIF bit can only be set by the module when a message is received. The bit is cleared by the user when it has completed processing the message in the buffer. If the RBIE bit is set, an interrupt will be generated when a message is received.

#### 18.4.2 FIFO BUFFER MODE

The ECAN module provides FIFO buffer functionality if the buffer pointer for a filter has a value of '1111'. In this mode, the results of a hit on that buffer will write to the next available buffer location within the FIFO.

The CiFCTRL register defines the size of the FIFO. The FSA<4:0> bits in this register define the start of the FIFO buffers. The end of the FIFO is defined by the DMABS<2:0> bits if DMA is enabled. Thus, FIFO sizes up to 32 buffers are supported.

#### 18.4.3 MESSAGE ACCEPTANCE FILTERS

The message acceptance filters and masks are used to determine if a message in the message assembly buffer should be loaded into either of the receive buffers. Once a valid message has been received into the Message Assembly Buffer (MAB), the identifier fields of the message are compared to the filter values. If there is a match, that message will be loaded into the appropriate receive buffer. Each filter is associated with a buffer pointer (FnBP<3:0>), which is used to link the filter to one of 16 receive buffers.

The acceptance filter looks at incoming messages for the IDE bit (CiTRBnSID<0>) to determine how to compare the identifiers. If the IDE bit is clear, the message is a standard frame and only filters with the EXIDE bit (CiRXFnSID<3>) clear are compared. If the IDE bit is set, the message is an extended frame, and only filters with the EXIDE bit set are compared.

### 18.4.4 MESSAGE ACCEPTANCE FILTER MASKS

The mask bits essentially determine which bits to apply the filter to. If any mask bit is set to a zero, then that bit will automatically be accepted regardless of the filter bit. There are three programmable acceptance filter masks associated with the receive buffers. Any of these three masks can be linked to each filter by selecting the desired mask in the FnMSK<1:0> bits in the appropriate CiFMSKSELn register.

#### 18.4.5 RECEIVE ERRORS

The CAN module will detect the following receive errors:

- Cyclic Redundancy Check (CRC) Error
- · Bit Stuffing Error
- · Invalid Message Receive Error

These receive errors do not generate an interrupt. However, the receive error counter is incremented by one in case one of these errors occur. The RXWAR bit (CilNTF<9>) indicates that the receive error counter has reached the CPU warning limit of 96 and an interrupt is generated.

#### 18.4.6 RECEIVE INTERRUPTS

Receive interrupts can be divided into 3 major groups, each including various conditions that generate interrupts:

#### · Receive Interrupt:

A message has been successfully received and loaded into one of the receive buffers. This interrupt is activated immediately after receiving the End-of-Frame (EOF) field. Reading the RXnIF flag will indicate which receive buffer caused the interrupt.

#### · Wake-up Interrupt:

The CAN module has woken up from Disable mode or the device has woken up from Sleep mode.

#### • Receive Error Interrupts:

A receive error interrupt will be indicated by the ERRIF bit. This bit shows that an error condition occurred. The source of the error can be determined by checking the bits in the CAN Interrupt Flag register, CilNTF.

#### - Invalid Message Received:

If any type of error occurred during reception of the last message, an error will be indicated by the IVRIF bit.

#### - Receiver Overrun:

The RBOVIF bit (CilNTF<2>) indicates that an overrun condition occurred.

#### - Receiver Warning:

The RXWAR bit indicates that the receive error counter (RERRCNT<7:0>) has reached the warning limit of 96.

#### - Receiver Error Passive:

The RXEP bit indicates that the receive error counter has exceeded the error passive limit of 127 and the module has gone into error passive state.

#### 18.5 Message Transmission

#### 18.5.1 TRANSMIT BUFFERS

The CAN module has up to eight transmit buffers, located in DMA RAM. These 8 buffers need to be configured as transmit buffers by setting the corresponding TX/RX buffer selection (TXENn or TXENm) bit in a CiTRmnCON register. The overall size of the CAN buffer area in DMA RAM is selectable by the user and is defined by the DMABS<2:0> bits (CiFCTRL<15:13>).

Each transmit buffer occupies 16 bytes of data. Eight of the bytes are the maximum 8 bytes of the transmitted message. Five bytes hold the standard and extended identifiers and other message arbitration information. The last byte is unused.

#### 18.5.2 TRANSMIT MESSAGE PRIORITY

Transmit priority is a prioritization within each node of the pending transmittable messages. There are four levels of transmit priority. If the TXnPRI<1:0> bits (in CiTRmnCON) for a particular message buffer are set to '11', that buffer has the highest priority. If the

TXnPRI<1:0> bits for a particular message buffer are set to '10' or '01', that buffer has an intermediate priority. If the TXnPRI<1:0> bits for a particular message buffer are '00', that buffer has the lowest priority. If two or more pending messages have the same priority, the messages are transmitted in decreasing order of buffer index.

#### 18.5.3 TRANSMISSION SEQUENCE

To initiate transmission of the message, the TXREQn bit (in CiTRmnCON) must be set. The CAN bus module resolves any timing conflicts between the setting of the TXREQn bit and the Start-of-Frame (SOF), ensuring that if the priority was changed, it is resolved correctly before the SOF occurs. When TXREQn is set, the TXABTn, TXLARBn and TXERRn flag bits are automatically cleared.

Setting the TXREQn bit simply flags a message buffer as enqueued for transmission. When the module detects an available bus, it begins transmitting the message which has been determined to have the highest priority.

If the transmission completes successfully on the first attempt, the TXREQn bit is cleared automatically and an interrupt is generated if TXnIE was set.

If the message transmission fails, one of the error condition flags will be set and the TXREQn bit will remain set, indicating that the message is still pending for transmission. If the message encountered an error condition during the transmission attempt, the TXERRn bit will be set and the error condition may cause an interrupt. If the message loses arbitration during the transmission attempt, the TXLARBn bit is set. No interrupt is generated to signal the loss of arbitration.

# 18.5.4 AUTOMATIC PROCESSING OF REMOTE TRANSMISSION REQUESTS

If the RTRENn bit (in the CiTRmnCON register) for a particular transmit buffer is set, the hardware automatically transmits the data in that buffer in response to remote transmission requests matching the filter that points to that particular buffer. The user does not need to manually initiate a transmission in this case.

### 18.5.5 ABORTING MESSAGE TRANSMISSION

The system can also abort a message by clearing the TXREQ bit associated with each message buffer. Setting the ABAT bit (CiCTRL1<12>) will request an abort of all pending messages. If the message has not yet started transmission, or if the message started but is interrupted by loss of arbitration or an error, the abort will be processed. The abort is indicated when the module sets the TXABT bit and the TXnIF flag is not automatically set.

#### 18.5.6 TRANSMISSION ERRORS

The CAN module will detect the following transmission errors:

- · Acknowledge Error
- Form Error
- Bit Error

These transmission errors will not necessarily generate an interrupt, but are indicated by the transmission error counter. However, each of these errors will cause the transmission error counter to be incremented by one. Once the value of the error counter exceeds the value of 96, the ERRIF (CiINTF<5>) and the TXWAR bit (CiINTF<10>) are set. Once the value of the error counter exceeds the value of 96, an interrupt is generated and the TXWAR bit in the Interrupt Flag register is set.

#### 18.5.7 TRANSMIT INTERRUPTS

Transmit interrupts can be divided into 2 major groups, each including various conditions that generate interrupts:

#### · Transmit Interrupt:

At least one of the three transmit buffers is empty (not scheduled) and can be loaded to schedule a message for transmission. Reading the TXnIF flags will indicate which transmit buffer is available and caused the interrupt.

#### • Transmit Error Interrupts:

A transmission error interrupt will be indicated by the ERRIF flag. This flag shows that an error condition occurred. The source of the error can be determined by checking the error flags in the CAN Interrupt Flag register, CiINTF. The flags in this register are related to receive and transmit errors.

- Transmitter Warning Interrupt:

The TXWAR bit indicates that the transmit error counter has reached the CPU warning limit of 96.

- Transmitter Error Passive:

The TXEP bit (CilNTF<12>) indicates that the transmit error counter has exceeded the error passive limit of 127 and the module has gone to error passive state.

- Bus Off:

The TXBO bit (CilNTF<13>) indicates that the transmit error counter has exceeded 255 and the module has gone to the bus off state.

Note: Both ECAN1 and ECAN2 can trigger a DMA data transfer. If C1TX, C1RX, C2TX or C2RX is selected as a DMA IRQ source, a DMA transfer occurs when the C1TXIF, C1RXIF, C2TXIF or C2RXIF bit gets set as a result of an ECAN1 or ECAN2 transmission or reception.

#### 18.6 Baud Rate Setting

All nodes on any particular CAN bus must have the same nominal bit rate. In order to set the baud rate, the following parameters have to be initialized:

- · Synchronization Jump Width
- · Baud Rate Prescaler
- · Phase Segments
- · Length Determination of Phase Segment 2
- Sample Point
- · Propagation Segment bits

#### 18.6.1 BIT TIMING

All controllers on the CAN bus must have the same baud rate and bit length. However, different controllers are not required to have the same master oscillator clock. At different clock frequencies of the individual controllers, the baud rate has to be adjusted by adjusting the number of time quanta in each segment.

The nominal bit time can be thought of as being divided into separate non-overlapping time segments. These segments are shown in Figure 18-2.

- Synchronization Segment (Sync Seg)
- Propagation Time Segment (Prop Seg)
- Phase Segment 1 (Phase1 Seg)
- Phase Segment 2 (Phase2 Seg)

The time segments and also the nominal bit time are made up of integer units of time called time quanta or Tq. By definition, the nominal bit time has a minimum of 8 Tq and a maximum of 25 Tq. Also, by definition, the minimum nominal bit time is 1  $\mu$ sec corresponding to a maximum bit rate of 1 MHz.

#### FIGURE 18-2: ECAN™ MODULE BIT TIMING

#### 18.6.2 PRESCALER SETTING

There is a programmable prescaler with integral values ranging from 1 to 64, in addition to a fixed divide-by-2 for clock generation. The time quantum (TQ) is a fixed unit of time derived from the oscillator period and is given by Equation 18-1.

Note: FCAN must not exceed 40 MHz. If CANCKS = 0, then FCY must not exceed 20 MHz.

### EQUATION 18-1: TIME QUANTUM FOR CLOCK GENERATION

TQ = 2 (BRP < 5:0 > + 1)/FCAN

#### 18.6.3 PROPAGATION SEGMENT

This part of the bit time is used to compensate physical delay times within the network. These delay times consist of the signal propagation time on the bus line and the internal delay time of the nodes. The Prop Seg can be programmed from 1 TQ to 8 TQ by setting the PRSEG<2:0> bits (CiCFG2<2:0>).

#### 18.6.4 PHASE SEGMENTS

The phase segments are used to optimally locate the sampling of the received bit within the transmitted bit time. The sampling point is between Phase1 Seg and Phase2 Seg. These segments are lengthened or shortened by resynchronization. The end of the Phase1 Seg determines the sampling point within a bit period. The segment is programmable from 1 TQ to 8 TQ. Phase2 Seg provides delay to the next transmitted data transition. The segment is programmable from 1 TQ to 8 TQ, or it may be defined to be equal to the greater of Phase1 Seg or the information processing time (2 TQ). The Phase1 Seg is initialized by setting bits SEG1PH<2:0> (CiCFG2<5:3>) and Phase2 Seg is initialized by setting SEG2PH<2:0> (CiCFG2<10:8>).

The following requirement must be fulfilled while setting the lengths of the phase segments:

Prop Seg + Phase1 Seg ≥ Phase2 Seg

#### 18.6.5 SAMPLE POINT

The sample point is the point of time at which the bus level is read and interpreted as the value of that respective bit. The location is at the end of Phase1 Seg. If the bit timing is slow and contains many TQ, it is possible to specify multiple sampling of the bus line at the sample point. The level determined by the CAN bus then corresponds to the result from the majority decision of three values. The majority samples are taken at the sample point and twice before with a distance of TQ/2. The CAN module allows the user to choose between sampling three times at the same point or once at the same point, by setting or clearing the SAM bit (CiCFG2<6>).

Typically, the sampling of the bit should take place at about 60-70% through the bit time, depending on the system parameters.

#### 18.6.6 SYNCHRONIZATION

To compensate for phase shifts between the oscillator frequencies of the different bus stations, each CAN controller must be able to synchronize to the relevant signal edge of the incoming signal. When an edge in the transmitted data is detected, the logic will compare the location of the edge to the expected time (Synchronous Segment). The circuit will then adjust the values of Phase1 Seg and Phase2 Seg. There are two mechanisms used to synchronize.

#### 18.6.6.1 Hard Synchronization

Hard synchronization is only done whenever there is a 'recessive' to 'dominant' edge during bus Idle, indicating the start of a message. After hard synchronization, the bit time counters are restarted with the Sync Seg. Hard synchronization forces the edge which has caused the hard synchronization to lie within the synchronization segment of the restarted bit time. If a hard synchronization is done, there will not be a resynchronization within that bit time.

#### 18.6.6.2 Resynchronization

As a result of resynchronization, Phase1 Seg may be lengthened or Phase2 Seg may be shortened. The amount of lengthening or shortening of the phase buffer segment has an upper boundary known as the synchronization jump width, and is specified by the SJW<1:0> bits (CiCFG1<7:6>). The value of the synchronization jump width will be added to Phase1 Seg or subtracted from Phase2 Seg. The resynchronization jump width is programmable between 1 TQ and 4 TQ.

The following requirement must be fulfilled while setting the SJW<1:0> bits:

Phase2 Seg > Synchronization Jump Width

Note: In the register descriptions that follow, 'i' in the register identifier denotes the specific ECAN module (ECAN1 or ECAN2).

'n' in the register identifier denotes the

buffer, filter or mask number.

'm' in the register identifier denotes the

'm' in the register identifier denotes the word number within a particular CAN data field.

bit 15-8 See Definition for Bits 7-0, Controls Buffer n

bit 7 TXENm: TX/RX Buffer Selection bit

1 = Buffer TRBn is a transmit buffer 0 = Buffer TRBn is a receive buffer

bit 6 **TXABTm:** Message Aborted bit<sup>(1)</sup>

1 = Message was aborted

0 = Message completed transmission successfully

bit 5 **TXLARBm:** Message Lost Arbitration bit<sup>(1)</sup>

1 = Message lost arbitration while being sent

0 = Message did not lose arbitration while being sent

bit 4 TXERRm: Error Detected During Transmission bit (1)

1 = A bus error occurred while the message was being sent

0 = A bus error did not occur while the message was being sent

bit 3 TXREQm: Message Send Request bit

Setting this bit to '1' requests sending a message. The bit will automatically clear when the message

is successfully sent. Clearing the bit to '0' while set will request a message abort.

bit 2 RTRENm: Auto-Remote Transmit Enable bit

1 = When a remote transmit is received. TXREQ will be set

0 = When a remote transmit is received, TXREQ will be unaffected

bit 1-0 **TXmPRI<1:0>:** Message Transmission Priority bits

11 = Highest message priority

10 = High intermediate message priority

01 = Low intermediate message priority

00 = Lowest message priority

**Note 1:** This bit is cleared when TXREQ is set.

**Note:** The buffers, SID, EID, DLC, Data Field and Receive Status registers are stored in DMA RAM. These are not Special Function Registers.

Encodes number of filter that resulted in writing this buffer.

bit 7-0 **Unimplemented:** Read as '0'

NOTES:

#### 19.0 10-BIT/12-BIT A/D CONVERTER

**Note:** This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F"

Family Reference Manual" (DS70046).

The PIC24H devices have up to 32 A/D input channels. These devices also have up to 2 A/D converter modules (ADCx, where 'x' = 1 or 2), each with its own set of Special Function Registers.

The AD12B bit (ADxCON1<10>) allows each of the A/D modules to be configured by the user as either a 10-bit, 4-sample/hold A/D (default configuration) or a 12-bit, 1-sample/hold A/D.

**Note:** The A/D module needs to be disabled before modifying the AD12B bit.

#### 19.1 Key Features

The 10-bit A/D configuration has the following key features:

- Successive Approximation (SAR) conversion
- Conversion speeds of up to 1.1 Msps
- Up to 32 analog input pins
- · External voltage reference input pins
- Simultaneous sampling of up to four analog input pins
- · Automatic Channel Scan mode
- Selectable conversion trigger source
- Selectable Buffer Fill modes
- Four result alignment options (signed/unsigned, fractional/integer)
- Operation during CPU Sleep and Idle modes

The 12-bit A/D configuration supports all the above features, except:

- In the 12-bit configuration, conversion speeds of up to 500 ksps are supported
- There is only 1 sample/hold amplifier in the 12-bit configuration, so simultaneous sampling of multiple channels is not supported.

Depending on the particular device pinout, the A/D converter can have up to 32 analog input pins, designated AN0 through AN31. In addition, there are two analog input pins for external voltage reference connections. These voltage reference inputs may be shared with other analog input pins. The actual number of analog input pins and external voltage reference input configuration will depend on the specific device. Refer to the device data sheet for further details.

A block diagram of the A/D converter is shown in Figure 19-1.

#### 19.2 A/D Initialization

The following configuration steps should be performed.

- 1. Configure the A/D module:
  - a) Select port pins as analog inputs (ADxPCFGH<15:0> or ADxPCFGL<15:0>)
  - Select voltage reference source to match expected range on analog inputs (ADxCON2<15:13>)
  - Select the analog conversion clock to match desired data rate with processor clock (ADxCON3<5:0>)
  - d) Determine how many S/H channels will be used (ADxCON2<9:8> and ADxPCFGH<15:0> or ADxPCFGL<15:0>)
  - e) Select the appropriate sample/conversion sequence (ADxCON1<7:5> and ADxCON3<12:8>)
  - f) Select how conversion results are presented in the buffer (ADxCON1<9:8>)
  - g) Turn on A/D module (ADxCON1<15>)
- 2. Configure A/D interrupt (if required):
  - a) Clear the ADxIF bit
  - b) Select A/D interrupt priority

#### 19.3 ADC and DMA

If more than one conversion result needs to be buffered before triggering an interrupt, DMA data transfers can be used. Both ADC1 and ADC2 can trigger a DMA data transfer. If ADC1 or ADC2 is selected as the DMA IRQ source, a DMA transfer occurs when the AD1IF or AD2IF bit gets set as a result of an ADC1 or ADC2 sample conversion sequence.

The SMPI<3:0> bits (ADxCON2<5:2>) are used to select how often the DMA RAM buffer pointer is incremented.

The ADDMABM bit (ADxCON1<12>) determines how the conversion results are filled in the DMA RAM buffer area being used for ADC. If this bit is set, DMA buffers are written in the order of conversion. The module will provide an address to the DMA channel that is the same as the address used for the non-DMA stand-alone buffer. If the ADDMABM bit is cleared, then DMA buffers are written in Scatter/Gather mode. The module will provide a scatter/gather address to the DMA channel, based on the index of the analog input and the size of the DMA buffer.

bit 15 ADON: A/D Operating Mode bit

1 = A/D converter module is operating

0 = A/D converter is off

bit 14 **Unimplemented:** Read as '0' bit 13 **ADSIDL:** Stop in Idle Mode bit

1 = Discontinue module operation when device enters Idle mode

0 = Continue module operation in Idle mode

bit 12 ADDMABM: DMA Buffer Build Mode bit

1 = DMA buffers are written in the order of conversion. The module will provide an address to the DMA channel that is the same as the address used for the non-DMA stand-alone buffer.

0 = DMA buffers are written in Scatter/Gather mode. The module will provide a scatter/gather address to the DMA channel, based on the index of the analog input and the size of the DMA buffer.

bit 11 **Unimplemented:** Read as '0'

bit 10 AD12B: 10-bit or 12-bit Operation Mode bit

1 = 12-bit, 1-channel A/D operation

0 = 10-bit, 4-channel A/D operation

bit 9-8 **FORM<1:0>:** Data Output Format bits

For 10-bit operation:

11 = Signed fractional (Dout = sddd dddd dd00 0000, where s = .NOT.d<9>)

10 = Fractional (Dout = dddd dddd dd00 0000)

01 = Signed integer (Dout = ssss sssd dddd dddd, where s = .NOT.d<9>)

00 = Integer (Dout = 0000 00dd dddd dddd)

For 12-bit operation:

11 = Signed fractional (Dout = sddd dddd dddd 0000, where s = .NOT.d<11>)

10 = Fractional (Dout = dddd dddd dddd 0000)

01 = Signed Integer (Dout = ssss sddd dddd, where s = .NOT.d<11>)

00 = Integer (Dout = 0000 dddd dddd dddd)

bit 7-5 SSRC<2:0>: Sample Clock Source Select bits

111 = Internal counter ends sampling and starts conversion (auto-convert)

110 = Reserved

101 = Reserved

100 = Reserved

011 = Reserved

010 = GP timer (Timer3 for ADC1, Timer5 for ADC2) compare ends sampling and starts conversion

001 = Active transition on INTx pin ends sampling and starts conversion

000 = Clearing sample bit ends sampling and starts conversion

bit 4 Unimplemented: Read as '0'

#### REGISTER 19-1: ADxCON1: ADCx CONTROL REGISTER 1 (CONTINUED)(where x = 1 or 2)

bit 3 SIMSAM: Simultaneous Sample Select bit (only applicable when CHPS<1:0> = 01 or 1x)

When AD12B = 1, SIMSAM is: U-0, Unimplemented, Read as '0'

1 = Samples CH0, CH1, CH2, CH3 simultaneously (when CHPS<1:0> = 1x); or Samples CH0 and CH1 simultaneously (when CHPS<1:0> = 01)

0 = Samples multiple channels individually in sequence

bit 2 ASAM: A/D Sample Auto-Start bit

1 = Sampling begins immediately after last conversion. SAMP bit is auto-set.

0 = Sampling begins when SAMP bit is set

bit 1 SAMP: A/D Sample Enable bit

1 = A/D sample/hold amplifiers are sampling0 = A/D sample/hold amplifiers are holding

If ASAM = 0, software may write '1' to begin sampling. Automatically set by hardware if ASAM = 1. If SSRC = 000, software may write '0' to end sampling and start conversion. If SSRC  $\neq$  000,

automatically cleared by hardware to end sampling and start conversion.

bit 0 **DONE:** A/D Conversion Status bit

1 = A/D conversion cycle is completed.

0 = A/D conversion not started or in progress

Automatically set by hardware when A/D conversion is complete. Software may write '0' to clear DONE status (software not allowed to write '1'). Clearing this bit will NOT affect any operation in progress. Automatically cleared by hardware at start of a new conversion.

-n = Value at POR '1' = Bit is set '0' = Bit is cleared x = Bit is unknown

bit 15-0 PCFG<15:0>: A/D Port Configuration Control bits

1 = Port pin in Digital mode, port read input enabled, A/D input multiplexor connected to AVss

0 = Port pin in Analog mode, port read input disabled, A/D samples pin voltage

**Note 1:** On devices without 16 analog inputs, all PCFG bits are R/W by user. However, PCFG bits are ignored on ports without a corresponding input on device.

2: On devices with 2 analog-to-digital modules, both AD1PCFGL and AD2PCFGL will affect the configuration of port pins multiplexed with AN0-AN15.

NOTES:

#### 20.0 SPECIAL FEATURES

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

PIC24H devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- · Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection and CodeGuard™ Security
- · JTAG Boundary Scan Interface
- In-Circuit Serial Programming<sup>™</sup> (ICSP<sup>™</sup>) programming capability
- · In-Circuit Emulation

### 20.1 Configuration Bits

The Configuration bits can be programmed (read as '0'), or left unprogrammed (read as '1'), to select various device configurations. These bits are mapped starting at program memory location 0xF80000.

The device Configuration register map is shown in Table 20-1.

The individual Configuration bit descriptions for the FBS, FSS, FGS, FOSCSEL, FOSC, FWDT and FPOR Configuration registers are shown in Table 20-1.

Note that address 0xF80000 is beyond the user program memory space. In fact, it belongs to the configuration memory space (0x800000-0xFFFFFF), which can only be accessed using table reads and table writes.

The upper byte of all device Configuration registers should always be '1111 1111'. This makes them appear to be NOP instructions in the remote event that their locations are ever executed by accident. Since Configuration bits are not implemented in the corresponding locations, writing '1's to these locations has no effect on device operation.

To prevent inadvertent configuration changes during code execution, all programmable Configuration bits are write-once. After a bit is initially programmed during a power cycle, it cannot be written to again. Changing a device configuration requires that power to the device be cycled.

### 20.2 On-Chip Voltage Regulator

All of the PIC24H devices power their core digital logic at a nominal 2.5V. This may create an issue for designs that are required to operate at a higher typical voltage, such as 3.3V. To simplify system design, all devices in the PIC24H family incorporate an on-chip regulator that allows the device to run its core logic from VDD.

The regulator provides power to the core from the other VDD pins. When the regulator is enabled, a low-ESR (less than 5 ohms) capacitor (such as tantalum or ceramic) must be connected to the VDDCORE/VCAP pin (Figure 20-1). This helps to maintain the stability of the regulator. The recommended value for the filter capacitor is provided in TABLE 23-12: "Internal Voltage Regulator Specifications" located in Section 23.1 "DC Characteristics".

On a POR, it takes approximately 20  $\mu s$  for the on-chip voltage regulator to generate an output voltage. During this time, designated as TSTARTUP, code execution is disabled. TSTARTUP is applied every time the device resumes operation after any power-down.

FIGURE 20-1: CONNECTIONS FOR THE ON-CHIP VOLTAGE REGULATOR<sup>(1)</sup>

Note 1: These are typical operating voltages. Refer to TABLE 23-12: "Internal Voltage Regulator Specifications" located in Section 23.1 "DC Characteristics" for the full operating ranges of VDD and VDDCORE.

### 20.3 Watchdog Timer (WDT)

For PIC24H devices, the WDT is driven by the LPRC oscillator. When the WDT is enabled, the clock source is also enabled.

The nominal WDT clock source from LPRC is 32 kHz. This feeds a prescaler than can be configured for either 5-bit (divide-by-32) or 7-bit (divide-by-128) operation. The prescaler is set by the WDTPRE Configuration bit. With a 32 kHz input, the prescaler yields a nominal WDT time-out period (TWDT) of 1 ms in 5-bit mode, or 4 ms in 7-bit mode.

A variable postscaler divides down the WDT prescaler output and allows for a wide range of time-out periods. The postscaler is controlled by the WDTPOST<3:0> Configuration bits (FWDT<3:0>) which allow the selection of a total of 16 settings, from 1:1 to 1:32,768. Using the prescaler and postscaler, time-out periods ranging from 1 ms to 131 seconds can be achieved.

The WDT, prescaler and postscaler are reset:

- · On any device Reset
- On the completion of a clock switch, whether invoked by software (i.e., setting the OSWEN bit after changing the NOSC bits) or by hardware (i.e., Fail-Safe Clock Monitor)
- When a PWRSAV instruction is executed (i.e., Sleep or Idle mode is entered)
- When the device exits Sleep or Idle mode to resume normal operation
- . By a CLRWDT instruction during normal execution

If the WDT is enabled, it will continue to run during Sleep or Idle modes. When the WDT time-out occurs, the device will wake the device and code execution will continue from where the PWRSAV instruction was executed. The corresponding SLEEP or IDLE bits (RCON<3,2>) will need to be cleared in software after the device wakes up.

The WDT flag bit, WDTO (RCON<4>), is not automatically cleared following a WDT time-out. To detect subsequent WDT events, the flag must be cleared in software.

Note: The CLRWDT and PWRSAV instructions clear the prescaler and postscaler counts when executed.

The WDT is enabled or disabled by the FWDTEN Configuration bit in the FWDT Configuration register. When the FWDTEN Configuration bit is set, the WDT is always enabled.

The WDT can be optionally controlled in software when the FWDTEN Configuration bit has been programmed to '0'. The WDT is enabled in software by setting the SWDTEN control bit (RCON<5>). The SWDTEN control bit is cleared on any device Reset. The software WDT option allows the user to enable the WDT for critical code segments and disable the WDT during non-critical segments for maximum power savings.

Note: If the WINDIS bit (FWDT<6>) is cleared, the CLRWDT instruction should be executed by the application software only during the last 1/4 of the WDT period. This CLRWDT window can be determined by using a timer. If a CLRWDT instruction is executed before

this window, a WDT Reset occurs.

#### FIGURE 20-2: WDT BLOCK DIAGRAM

#### 20.4 JTAG Interface

PIC24H devices implement a JTAG interface, which supports boundary scan device testing, as well as in-circuit programming. Detailed information on the interface will be provided in future revisions of the document.

# 20.5 Code Protection and CodeGuard™ Security

The PIC24H product families offer advanced implementation of CodeGuard™ Security. CodeGuard Security enables multiple parties to securely share resources (memory, interrupts and peripherals) on a single chip. This feature helps protect individual Intellectual Property in collaborative system designs.

When coupled with software encryption libraries, CodeGuard Security can be used to securely update Flash even when multiple IP are resident on the single chip. The code protection features vary depending on the actual PIC24H implemented. The following sections provide an overview these features.

The code protection features are controlled by the Configuration registers: FBS, FSS and FGS.

Note:

Refer to CodeGuard Security Reference Manual (DS70180) for further information on usage, configuration and operation of CodeGuard Security.

# 20.6 In-Circuit Serial Programming Programming Capability

PIC24H family digital signal controllers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data and three other lines for power, ground and the programming sequence. This allows customers to manufacture boards with unprogrammed devices and then program the digital signal controller just before shipping the product. This also allows the most recent firmware or a custom firmware, to be programmed. Please refer to the "dsPIC33F Flash Programming Specification" (DS70152) document for details about ICSP programming capability.

Any 1 out of 3 pairs of programming clock/data pins may be used:

- PGC1/EMUC1 and PGD1/EMUD1
- PGC2/EMUC2 and PGD2/EMUD2
- PGC3/EMUC3 and PGD3/EMUD3

### 20.7 In-Circuit Debugger

When MPLAB® ICD 2 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the EMUCx (Emulation/Debug Clock) and EMUDx (Emulation/Debug Data) pin functions.

Any 1 out of 3 pairs of debugging clock/data pins may be used:

- PGC1/EMUC1 and PGD1/EMUD1
- PGC2/EMUC2 and PGD2/EMUD2
- PGC3/EMUC3 and PGD3/EMUD3

To use the in-circuit debugger function of the device, the design must implement ICSP programming capability connections to MCLR, VDD, Vss, PGC, PGD and the EMUDx/EMUCx pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

NOTES:

#### 21.0 INSTRUCTION SET SUMMARY

Note:

This data sheet summarizes the features of this group of PIC24H devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The PIC24H instruction set is identical to that of the PIC24F, and is a subset of the dsPIC30F/33F instruction set.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- · Word or byte-oriented operations
- · Bit-oriented operations
- Literal operations
- · DSP operations
- · Control operations

Table 21-1 shows the general symbols used in describing the instructions.

The PIC24H instruction set summary in Table 21-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand which is typically a register 'Wb' without any address modifier
- The second source operand which is typically a register 'Ws' with or without an address modifier
- The destination of the result which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- · The file register specified by the value 'f'
- The destination, which could either be the file register 'f' or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement may use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by the value of 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand which is a register 'Wb' without any address modifier
- The second source operand which is a literal value
- The destination of the result (only if not the same as the first source operand) which is typically a register 'Wd' with or without an address modifier

The control instructions may use some of the following operands:

- · A program memory address
- The mode of the table read and table write instructions

All instructions are a single word, except for certain double word instructions, which were made double word instructions so that all the required information is available in these 48 bits. In the second word, the 8 MSbs are '0's. If this second word is executed as an instruction (by itself), it will execute as a NOP.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true, or the program counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO, all table

reads and writes and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or double word instruction. Moreover, double word moves require two cycles. The double word instructions execute in two instruction cycles.

**Note:** For more details on the instruction set, refer to the "dsPIC30F/33F Programmer's Reference Manual" (DS70157).

TABLE 21-1: SYMBOLS USED IN OPCODE DESCRIPTIONS

| Field           | Description   |
|-----------------|---|
| #text           | Means literal defined by "text"   |
| (text)          | Means "content of text"   |
| [text]          | Means "the location addressed by text"  |
| { }             | Optional field or operation   |
| <n:m></n:m>     | Register bit field  |
| .b              | Byte mode selection   |
| .d              | Double Word mode selection  |
| .S              | Shadow register select  |
| .W              | Word mode selection (default)   |
| bit4            | 4-bit bit selection field (used in word addressed instructions) ∈ {015}   |
| C, DC, N, OV, Z | MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero  |
| Expr            | Absolute address, label or expression (resolved by the linker)  |
| f               | File register address ∈ {0x00000x1FFF}  |
| lit1            | 1-bit unsigned literal ∈ {0,1}  |
| lit4            | 4-bit unsigned literal ∈ {015}  |
| lit5            | 5-bit unsigned literal ∈ {031}  |
| lit8            | 8-bit unsigned literal ∈ {0255}   |
| lit10           | 10-bit unsigned literal ∈ {0255} for Byte mode, {0:1023} for Word mode  |
| lit14           | 14-bit unsigned literal ∈ {016384}  |
| lit16           | 16-bit unsigned literal ∈ {065535}  |
| lit23           | 23-bit unsigned literal ∈ {08388608}; LSB must be '0'   |
| None            | Field does not require an entry, may be blank   |
| PC              | Program Counter   |
| Slit10          | 10-bit signed literal ∈ {-512511}   |
| Slit16          | 16-bit signed literal ∈ {-3276832767}   |
| Slit6           | 6-bit signed literal ∈ {-1616}  |
| Wb              | Base W register ∈ {W0W15}   |
| Wd              | Destination W register ∈ { Wd, [Wd], [Wd++], [Wd], [++Wd], [Wd] }   |
| Wdo             | Destination W register ∈ { Wnd, [Wnd], [Wnd++], [Wnd], [++Wnd], [Wnd], [Wnd+Wb] }   |
| Wm,Wn           | Dividend, Divisor working register pair (direct addressing)   |
| Wm*Wm           | Multiplicand and Multiplier working register pair for Square instructions ∈ {W4 * W4,W5 * W5,W6 * W6,W7 * W7}                 |
| Wm*Wn           | Multiplicand and Multiplier working register pair for DSP instructions ∈<br>{W4 * W5,W4 * W6,W4 * W7,W5 * W6,W5 * W7,W6 * W7} |
| Wn              | One of 16 working registers ∈ {W0W15}   |

### TABLE 21-1: SYMBOLS USED IN OPCODE DESCRIPTIONS (CONTINUED)

| Field  | Description   |  |  |  |
|--|---|--|--|--|
| Wnd  | One of 16 destination working registers ∈ {W0W15}                     |  |  |  |
| Wns One of 16 source working registers ∈ {W0W15} |   |  |  |  |
| WREG   | W0 (working register used in file register instructions)              |  |  |  |
| Ws   | Source W register ∈ { Ws, [Ws], [Ws++], [Ws], [++Ws], [Ws] }          |  |  |  |
| Wso  | Source W register ∈ { Wns, [Wns++], [Wns], [++Wns], [Wns], [Wns+Wb] } |  |  |  |

#### 22.0 DEVELOPMENT SUPPORT

The PICmicro<sup>®</sup> microcontrollers are supported with a full range of hardware and software development tools:

- Integrated Development Environment
  - MPLAB® IDE Software
- Assemblers/Compilers/Linkers
  - MPASM™ Assembler
  - MPLAB C18 and MPLAB C30 C Compilers
  - MPLINK<sup>TM</sup> Object Linker/ MPLIB<sup>TM</sup> Object Librarian
  - MPLAB ASM30 Assembler/Linker/Library
- Simulators
  - MPLAB SIM Software Simulator
- Emulators
  - MPLAB ICE 2000 In-Circuit Emulator
  - MPLAB ICE 4000 In-Circuit Emulator
- In-Circuit Debugger
  - MPLAB ICD 2
- Device Programmers
  - PICSTART® Plus Development Programmer
  - MPLAB PM3 Device Programmer
  - PICkit™ 2 Development Programmer
- Low-Cost Demonstration and Development Boards and Evaluation Kits

# 22.1 MPLAB Integrated Development Environment Software

The MPLAB IDE software brings an ease of software development previously unseen in the 8/16-bit micro-controller market. The MPLAB IDE is a Windows® operating system-based application that contains:

- A single graphical interface to all debugging tools
  - Simulator
  - Programmer (sold separately)
  - Emulator (sold separately)
  - In-Circuit Debugger (sold separately)
- A full-featured editor with color-coded context
- · A multiple project manager
- Customizable data windows with direct edit of contents
- · High-level source code debugging
- Visual device initializer for easy register initialization
- · Mouse over variable inspection
- Drag and drop variables from source to watch windows
- · Extensive on-line help
- Integration of select third party tools, such as HI-TECH Software C Compilers and IAR C Compilers

The MPLAB IDE allows you to:

- Edit your source files (either assembly or C)
- One touch assemble (or compile) and download to PICmicro MCU emulator and simulator tools (automatically updates all project information)
- · Debug using:
  - Source files (assembly or C)
  - Mixed assembly and C
  - Machine code

MPLAB IDE supports multiple debugging tools in a single development paradigm, from the cost-effective simulators, through low-cost in-circuit debuggers, to full-featured emulators. This eliminates the learning curve when upgrading to tools with increased flexibility and power.

#### 22.2 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for all PICmicro MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multi-purpose source files
- Directives that allow complete control over the assembly process

# 22.3 MPLAB C18 and MPLAB C30 C Compilers

The MPLAB C18 and MPLAB C30 Code Development Systems are complete ANSI C compilers for Microchip's PIC18 family of microcontrollers and the dsPIC30, dsPIC33 and PIC24 family of digital signal controllers. These compilers provide powerful integration capabilities, superior code optimization and ease of use not found with other compilers.

For easy source level debugging, the compilers provide symbol information that is optimized to the MPLAB IDE debugger.

### 22.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler and the MPLAB C18 C Compiler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

### 22.5 MPLAB ASM30 Assembler, Linker and Librarian

MPLAB ASM30 Assembler produces relocatable machine code from symbolic assembly language for dsPIC30F devices. MPLAB C30 C Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire dsPIC30F instruction set
- · Support for fixed-point and floating-point data
- · Command line interface
- · Rich directive set
- · Flexible macro language
- · MPLAB IDE compatibility

#### 22.6 MPLAB SIM Software Simulator

The MPLAB SIM Software Simulator allows code development in a PC-hosted environment by simulating the PICmicro MCUs and dsPIC® DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB SIM Software Simulator fully supports symbolic debugging using the MPLAB C18 and MPLAB C30 C Compilers, and the MPASM and MPLAB ASM30 Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

# 22.7 MPLAB ICE 2000 High-Performance In-Circuit Emulator

The MPLAB ICE 2000 In-Circuit Emulator is intended to provide the product development engineer with a complete microcontroller design tool set for PICmicro microcontrollers. Software control of the MPLAB ICE 2000 In-Circuit Emulator is advanced by the MPLAB Integrated Development Environment, which allows editing, building, downloading and source debugging from a single environment.

The MPLAB ICE 2000 is a full-featured emulator system with enhanced trace, trigger and data monitoring features. Interchangeable processor modules allow the system to be easily reconfigured for emulation of different processors. The architecture of the MPLAB ICE 2000 In-Circuit Emulator allows expansion to support new PICmicro microcontrollers.

The MPLAB ICE 2000 In-Circuit Emulator system has been designed as a real-time emulation system with advanced features that are typically found on more expensive development tools. The PC platform and Microsoft® Windows® 32-bit operating system were chosen to best make these features available in a simple, unified application.

### 22.8 MPLAB ICE 4000 High-Performance In-Circuit Emulator

The MPLAB ICE 4000 In-Circuit Emulator is intended to provide the product development engineer with a complete microcontroller design tool set for high-end PICmicro MCUs and dsPIC DSCs. Software control of the MPLAB ICE 4000 In-Circuit Emulator is provided by the MPLAB Integrated Development Environment, which allows editing, building, downloading and source debugging from a single environment.

The MPLAB ICE 4000 is a premium emulator system, providing the features of MPLAB ICE 2000, but with increased emulation memory and high-speed performance for dsPIC30F and PIC18XXXX devices. Its advanced emulator features include complex triggering and timing, and up to 2 Mb of emulation memory.

The MPLAB ICE 4000 In-Circuit Emulator system has been designed as a real-time emulation system with advanced features that are typically found on more expensive development tools. The PC platform and Microsoft Windows 32-bit operating system were chosen to best make these features available in a simple, unified application.

### 22.9 MPLAB ICD 2 In-Circuit Debugger

Microchip's In-Circuit Debugger, MPLAB ICD 2, is a powerful, low-cost, run-time development tool, connecting to the host PC via an RS-232 or high-speed USB interface. This tool is based on the Flash PICmicro MCUs and can be used to develop for these and other PICmicro MCUs and dsPIC DSCs. The MPLAB ICD 2 utilizes the in-circuit debugging capability built into the Flash devices. This feature, along with Microchip's In-Circuit Serial Programming™ (ICSP™) protocol, offers cost-effective, in-circuit Flash debugging from the graphical user interface of the MPLAB Integrated Development Environment. This enables a designer to develop and debug source code by setting breakpoints, single stepping and watching variables, and CPU status and peripheral registers. Running at full speed enables testing hardware and applications in real time. MPLAB ICD 2 also serves as a development programmer for selected PICmicro MCU devices.

### 22.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages and a modular, detachable socket assembly to support various package types. The ICSP™ programming capability cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PICmicro MCU devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices and incorporates an SD/MMC card for file storage and secure data applications.

# 22.11 PICSTART Plus Development Programmer

The PICSTART Plus Development Programmer is an easy-to-use, low-cost, prototype programmer. It connects to the PC via a COM (RS-232) port. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. The PICSTART Plus Development Programmer supports most PICmicro MCU devices in DIP packages up to 40 pins. Larger pin count devices, such as the PIC16C92X and PIC17C76X, may be supported with an adapter socket. The PICSTART Plus Development Programmer is CE compliant.

### 22.12 PICkit 2 Development Programmer

The PICkit™ 2 Development Programmer is a low-cost programmer with an easy-to-use interface for programming many of Microchip's baseline, mid-range and PIC18F families of Flash memory microcontrollers. The PICkit 2 Starter Kit includes a prototyping development board, twelve sequential lessons, software and HI-TECH's PICC™ Lite C compiler, and is designed to help get up to speed quickly using PIC® microcontrollers. The kit provides everything needed to program, evaluate and develop applications using Microchip's powerful, mid-range Flash memory family of microcontrollers.

# 22.13 Demonstration, Development and Evaluation Boards

A wide variety of demonstration, development and evaluation boards for various PICmicro MCUs and dsPIC DSCs allows quick application development on fully functional systems. Most boards include prototyping areas for adding custom circuitry and provide application firmware and source code for examination and modification.

The boards support a variety of features, including LEDs, temperature sensors, switches, speakers, RS-232 interfaces, LCD displays, potentiometers and additional EEPROM memory.

The demonstration and development boards can be used in teaching environments, for prototyping custom circuits and for learning about various microcontroller applications.

In addition to the PICDEM<sup>TM</sup> and dsPICDEM<sup>TM</sup> demonstration/development board series of circuits, Microchip has a line of evaluation kits and demonstration software for analog filter design, Keeloq® security ICs, CAN, IrDA®, PowerSmart® battery management, SEEVAL® evaluation system, Sigma-Delta ADC, flow rate sensing, plus many more.

Check the Microchip web page (www.microchip.com) and the latest "Product Selector Guide" (DS00148) for the complete list of demonstration, development and evaluation kits.

### 23.0 ELECTRICAL CHARACTERISTICS

This section provides an overview of PIC24H electrical characteristics. Additional information will be provided in future revisions of this document as it becomes available.

Absolute maximum ratings for the PIC24H family are listed below. Exposure to these maximum rating conditions for extended periods may affect device reliability. Functional operation of the device at these or any other conditions above the parameters indicated in the operation listings of this specification is not implied.

### Absolute Maximum Ratings<sup>(Note 1)</sup>

| Ambient temperature under bias   | 40°C to +85°C        |
|--|----------------------|
| Storage temperature  |                      |
| Voltage on VDD with respect to Vss   |                      |
| Voltage on any combined analog and digital pin and MCLR, with respect to Vss | 0.3V to (VDD + 0.3V) |
| Voltage on any digital-only pin with respect to Vss                          | 0.3V to +5.6V        |
| Voltage on VDDCORE with respect to Vss                                       | 2.25V to 2.75V       |
| Maximum current out of Vss pin   | 300 mA               |
| Maximum current into VDD pin (Note 2)  | 250 mA               |
| Maximum output current sunk by any I/O pin (Note 3)                          | 4 mA                 |
| Maximum output current sourced by any I/O pin (Note 3)                       | 4 mA                 |
| Maximum current sunk by all ports  | 200 mA               |
| Maximum current sourced by all ports (Note 2)                                | 200 mA               |

- **Note 1:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
  - 2: Maximum allowable current is a function of device maximum power dissipation (see Table 23-2).
  - **3:** Exceptions are CLKOUT, which is able to sink/source 25 mA, and the VREF+, VREF-, SCLx, SDAx, PGCx and PGDx pins, which are able to sink/source 12 mA.

| DC20a            | 26                        | _   | mA   | +85°C | 3.3 V        | TO WIII 3 |  |  |
| DC21             | 33                        | 1   | mA   | +25°C | 3.3V         | 16 MIPS   |  |  |
| DC21a            | 32                        | _   | mA   | +85°C | 3.37         | 10 MIFS   |  |  |
| DC22             | 44                        | _   | mA   | +25°C | 3.3V         | 20 MIPS   |  |  |
| DC22a            | 43                        | _   | mA   | +85°C | 3.37         | 20 MIPS   |  |  |
| DC23             | 60                        | _   | mA   | +25°C | 3.3V         | 30 MIPS   |  |  |
| DC23a            | 58                        | _   | mA   | +85°C | 3.37         | 30 IVIIPS |  |  |
| DC24             | 74                        | _   | mA   | +25°C | 3.3V 40 MIPS |           |  |  |
| DC24a            | 72                        | _   | mA   | +85°C | 3.37         | 40 MIPS   |  |  |

**Legend:** TBD = To Be Determined

- **Note 1:** Data in "Typical" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
  - 2: The supply current is mainly a function of the operating voltage and frequency. Other factors, such as I/O pin loading and switching rate, oscillator type, internal code execution pattern and temperature, also have an impact on the current consumption. The test conditions for all IDD measurements are as follows: OSC1 driven with external square wave from rail to rail. All I/O pins are configured as inputs and pulled to Vss. MCLR = VDD, WDT and FSCM are disabled. CPU, SRAM, program memory and data memory are operational. No peripheral modules are operating; however, every peripheral is being clocked (PMD bits are all zeroed.

**Legend:** TBD = To Be Determined

**Note 1:** Data in "Typ" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

**3:** Negative current is defined as current sourced by the pin.

<sup>2:</sup> The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

**Legend:** TBD = To Be Determined

- Note 1: Data in "Typ" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
  - Instruction cycle period (TCY) equals two times the input oscillator time base period. All specified values 2: are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min." values with an external clock applied to the OSC1/CLKI pin. When an external clock input is used, the "max." cycle time limit is "DC" (no clock) for all devices.
  - 3: Measurements are taken in EC mode. The CLKO signal is measured on the OSC2 pin.

Note 1: These parameters are characterized but not tested in manufacturing.

- 2: Data in "Typ" column is at 5V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.
- **3:** The minimum clock period for SCKx is 100 ns. Therefore, the clock generated in Master mode must not violate this specification.
- 4: Assumes 50 pF load on all SPIx pins.

**Legend:** TBD = To Be Determined

Note 1: BRG is the value of the I<sup>2</sup>C Baud Rate Generator. Refer to **Section 21.** "Inter-Integrated Circuit (I<sup>2</sup>C™)" in the "dsPIC30F Family Reference Manual" (DS70046).

2: Maximum pin capacitance = 10 pF for all I2Cx pins (for 1 MHz mode only).

| AD62         | tcss               | Conversion Completion to Sample Start (ASAM = 1) <sup>(3)</sup>      | _         | 0.5 TAD   |         | _     | _   |  |
| AD63         | tDPU               | Time to Stabilize Analog Stage from A/D Off to A/D On <sup>(3)</sup> | _         | 20  | _       | μs    | _   |  |

**Note 1:** These parameters are characterized but not tested in manufacturing.

**<sup>2:</sup>** Because the sample caps will eventually lose charge, clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures.

<sup>3:</sup> Characterized by design but not tested.

- 1 Software sets ADxCON. SAMP to start sampling.
- ② Sampling starts after discharge period.
  TSAMP is described in the "dsPIC30F Family Reference Manual" (DS70046), Section 17.
- (3) Software clears ADxCON. SAMP to start conversion.
- 4 Sampling ends, conversion sequence starts.
- (5) Convert bit 11.
- 6 Convert bit 10.
- 7 Convert bit 1.
- 8 Convert bit 0.
- One TAD for end of conversion.

**Legend:** TBD = To Be Determined

**Note 1:** Because the sample caps will eventually lose charge, clock rates below 10 kHz can affect linearity performance, especially at elevated temperatures.

### 24.0 PACKAGING INFORMATION

# 24.1 Package Marking Information

64-Lead TQFP (10x10x1 mm)

100-Lead TQFP (12x12x1 mm)

100-Lead TQFP (14x14x1mm)

## Example

### Example

100-Lead TQFP (14x14x1mm)

Legend: XX...X Customer-specific information
Year code (last digit of calendar year)
YY Year code (last 2 digits of calendar year)
WW Week code (week of January 1 is week '01')
NNN Alphanumeric traceability code
Pb-free JEDEC designator for Matte Tin (Sn)
This package is Pb-free. The Pb-free JEDEC designator (a)
can be found on the outer packaging for this package.

**Note**: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

# 24.2 Package Details

The following sections give the technical details of the packages.

# 64-Lead Plastic Thin-Quad Flatpack (PT) 10x10x1 mm Body, 1.0/0.10 mm Lead Form (TQFP)

<sup>\*</sup> Controlling Parameter

#### Notes:

Dimensions D1 and E1 do not include mold flash or protrusions. Mold flash or protrusions shall not exceed .010" (0.254mm) per side. BSC: Basic Dimension. Theoretically exact value shown without tolerances.

See ASME Y14.5M

REF: Reference Dimension, usually without tolerance, for information purposes only.

See ASME Y14.5M

JEDEC Equivalent: MS-026

Drawing No. C04-110

Revised 07-21-05

## APPENDIX A: REVISION HISTORY

#### Revision A (February 2006)

· Initial release of this document

#### Revision B (March 2006)

- Updated the Configuration Bits Description table (Table 20.1)
- Updated registers and register maps
- Updated Section 15.0 "Serial Peripheral Interface (SPI)"
- Updated Section 23.0 "Electrical Characteristics"
- Updated pinout diagrams
- Additional minor corrections throughout document text

#### Revision C (May 2006)

- Updated Section 23.0 "Electrical Characteristics"
- Updated the Configuration Bits Description table (Table 20.1)
- Additional minor corrections throughout document text

#### Revision D (July 2006)

- Added FBS and FSS Device Configuration registers (see Table 20-1) and corresponding bit field descriptions (see Table 20-2). These added registers replaced the former RESERVED1 and RESERVED2 registers.
- Added INTTREG Interrupt Control and Status register. (See Section 6.3 "Interrupt Control and Status Registers". See also Register 6-33.)
- Added Core Registers BSRAM and SSRAM (see Section 3.2.7 "Data Ram Protection Feature")
- Clarified Fail-Safe Clock Monitor operation (see Section 8.3 "Fail-Safe Clock Monitor (FSCM)")
- Updated COSC<2:0> and NOSC<2:0> bit configurations in OSCCON register (see Register 8-1)
- Updated CLKDIV register bit configurations (see Register 8-2)
- Added Word Write Cycle Time parameter (Tww) to Program Flash Memory (see Table 23-11)
- Noted exceptions to Absolute Maximum Ratings on I/O pin output current (see Section 23.0 "Electrical Characteristics")
- Added ADC2 Event Trigger for Timer4/5 (Section 12.0 "Timer2/3, Timer4/5, Timer6/7 and Timer8/9")
- Corrected mislabeled I2COV bit in I2CxSTAT register (see Register 16-2)
- Removed AD26a, AD27a, AD28a, AD26b, AD27b and AD28b from Table 23-34 (A/D Module)
- Revised Table 23-36 (AD63)

NOTES:

#### THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

# CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

#### **CUSTOMER SUPPORT**

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- · Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

# READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

### PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

#### **Examples:**

- PIC24HJ256GP210I/PT: General-purpose PIC24H, 256 KB program memory, 100-pin, Industrial temp., TQFP package.
- b) PIC24HJ64GP506I/PT-ES: General-purpose PIC24H, 64 KB program memory, 64-pin, Industrial temp., TQFP package, Engineering Sample.
