Two consecutive rotations of 180°

GUIDE TO APPLICATION

1. AC Ripple Current:

The maximum allowable ripple current shall be determined from the formula:

IRMS = sqrt(P / RESR)

where,

P = power dissipation in W at +25 °C as given below

RESR = the capacitor Equivalent Series Resistance at the specified frequency.

2. AC Ripple Voltage:

The maximum allowable ripple voltage shall be determined from the formula:

VRMS = sqrt(P / RESR) x Z

where,

Z = the capacitor impedance at the specified frequency.

The calculations are summarized on the graphs in table "Typical Curves Ripple Voltage at +25 °C" giving the maximum available ripple voltage as a function of frequency.

However, the sum of the peak AC voltage plus the DC voltage shall not exceed the rated DC voltage at +85 °C of the capacitor. The sum of the negative peak AC voltage plus the DC voltage shall not allow a voltage reversal exceeding 15 % of the rated DC voltage.

3. AC Ripple Current or Voltage Derating Factor:

If these capacitors are to be operated at temperatures above +25 °C, the permissible RMS ripple current or voltage shall be calculated using the derating factors in the table below:

Table with 2 columns: TEMPERATURE, DERATING FACTOR with values for +25 °C, +55 °C, +85 °C, +125 °C.

4. Power Dissipation:

Power dissipation will be affected by the heat sinking capability of the mounting surface. Non-sinusoidal ripple current may produce heating effects which differ from those shown in the following table.

Table with 2 columns: CASE CODE, POWER DISSIPATION AT +25 °C (W) with values for cases A, B, C, D.
