# **1.Module Basic Specification**

- **1.1 Display Specifications** 
  - 1) Display Mode: Passive Matrix OLED
  - 2) Display Color: Blue (monochrome)
  - 3) Drive Duty: 1/16 Duty
  - 4) Controller Driver: SSD1311
  - 1.2 Module Features

Items	Specification	Unit
Diagonal A/A Size	2.06	Inch
Number of dots	16 Characters ( $5 \times 8$ dots ) $\times 2$ Lines	dot
Module size	$80 \times 36 \times 6.3$	mm
Active Area	$51.175 \times 10.78$	mm
viewing Area	53.175×12.78	mm
Character Pitch	3.235×5.71	mm
Character Size	$2.65 \times 5.07$	mm
Dot Pitch	$0.54 \times 0.64$	mm
Dot Size	$0.49 \times 0.59$	mm
General Tolerance	$\pm 0.20$	mm

### 1.4 Pin Definition

Pin number	Symbol	Туре	Function
1	VSS	P	Power supply ground
2	VDD	Р	3.3V power supply
3~10	D7~D0	I/O	These are 8-bit bi-directional data bus to be connected to the microprocessor's data bus. When serial mode is selected, D1 will be the serial data input SDIN and D0 will be the serial clock input SCLK. When I <sup>2</sup> C mode is selected, D2 & D1 should be tired together and serve as SDAout & SDAin in application and D0 is the serial clock input SCL.
11	RD	Ι	When interface to a 6800-series microprocessor, this pin will be used as the Enable(E) signal, When interface to an 8080-microprocessor, this pin receives the Read(RD#)signal. This is read/write control input pin connecting to the
12	RW	Ι	MCU interface. When interface to a 6800-series microprocessor, Read mode will be carried out when this pin is pulled HIGH and write mode when low .When interface to an 8080-microprocessor, this pin will be the data Write input. When serial interface is selected, this pin must be connected to Vss
13	DC	I	This is DATA/COMMAND control pin. When it is pulled HIGH, the data at $D[0~7]$ is treated as data. When it is pulled LOW, the data at $D[0~7]$ will be transferred to the command register. For detail relationship to MCU interface signals, please refer to the Timing Characteristics Diagrams.
14	RSE	Ι	This pin is reset signal input (active LOW)
15	CS	Ι	This pin is chip select input (active LOW)

#### 1.5 Jump

BS0 /BS1 /BS2:MUC bus inter	rface selection pin.
-----------------------------	----------------------

BS2	BS1	BS0	Interface
1	0	0	8-bit 6800 parallel
1	0	1	4-bit 6800 parallel
1	1	0	8-bit 8080 parallel
1	1	1	4-bit 8080 parallel

Notes: "0"connection GND and "1"connection V<sub>DD</sub>.

# 2.Absolute Maximum Ratings.

#### Notes1:

All the above voltages are on the basis of "Vss =0V "

#### Notes2:

When this module is used beyond the above absolute maximum ratings, permanent breakage of the module may occur, also for normal operations, it is desirable to use this module under the conditions according to Section 3."Optics and Electrical Characteristics "If this module is used beyond these conditions, malfunctioning of the module can occur and the reliability of the module may deteriorate.

#### Notes3:

 $V_{CC} = 7.25 V$ , Ta = 25° C, 50% Checkerboard.

Software configuration follows Section 6.4 Initialization. End of lifetime is specified as 50% of initial brightness reached. The average operating lifetime at room temperature is estimated by the accelerated operation at high temperature conditions.

# **3.Optics & Electrical Characteristics**

# 4. Functional Specification

#### 4.1 Commands

Command	R S	R/ W	DB 7	DB 6	DB 5	DB 4	DB 3	DB 2	DB 1	DB 0	Description	Execution time fosc=250khz
Clear Display	0	0	0	0	0	0	0	0	0	1	Clear the screen & return to the address 0	1.64ms
Return Home	0	0	0	0	0	0	0	0	1	X	Set DDRAM address to "00H", return cursor to its original position, if shifted. The contents of DDRAM are not changed.	1.64ms
Entry Mode Set	0	0	0	0	0	0	0	1	I/D	S	Assign cursor / blink moving direction with DDRAM address: I/D = "1": cursor/ blink moves to right &DDRAM address is increased by 1 (POR) $I/D = "0": cursor/ blink moves to left &DDRAM address is decreased by 1Assign display shift with DDRAMaddress.S = "1": make display shift of the enabledlines by the DS4 to DS1 bits in the shiftenable instruction. Left/ right directiondepends on I/D bit selection.S = "0": display shift disable (POR)$	40µs
Display ON/OFF Control	0	0	0	0	0	0	1	D	С	В	Set display/cursor/blink ON/OFF D = "1": display ON, D = "0": display OFF (POR), C = "1": cursor ON, C = "0": cursor OFF (POR), B = "1": blink ON, B = "0": blink OFF (POR).	40µs
Cursor or Display Shif	0	0	0	0	0	1	S/C	R/L	x	x	Set cursor moving and display shift control bit, and the direction, without changing DDRAM data. S/C = "1": display shift, S/C = "0": cursor shift, R/L = "1": shift to right, R/L = "0": shift to left	40µs
Feature set	0	0	0	0	1	DL	N	F	x	X	Setting the length of the data bus (DL), and display the number of rows (N) and character font (F) DL=1: 8 bits F=0: 5x7 dots DL=0: 4 bits F=1: 5x10 dots N=0: 1 row show N=1: 2 row show	40µs
Set CGRAM address	0	0	0	1	Ch	aracte	r Gene Ad	erator ( dress	CG) R	AM	Set CGRAM address in address counter. (POR=00 0000)	40µs
Set DDRAM Address	0	0	1	D	ispla	y Dat Cı	a (DD) ursor A	RAM ddress	Addre	ss /	Set the DD RAM address, DD RAM data to be transmitted and received in this order	40µs
Write data	1	0				W	rite Da	ita			Write data into internal RAM (DDRAM / CGRAM ).	46µs
Read Data	1	1				R	ead Da	ta			Read data from internal RAM (DDRAM / CGRAM ).	46µs

#### 4.2 Power down and Power up Sequence

To protect OEL panel and extend the panel life time, the driver IC power up/down routine should include a delay period between high voltage and low voltage power sources during turn on/off. It gives the OEL panel enough time to complete the action of charge and discharge before/after the operation.

4.2.1 Power up Sequence:

- 1. Power up  $V_{DD}$
- 2. Send Display off command
- 3. Initialization
- 4. Clear Screen
- 5. Power up  $V_{CC}$
- 6. Delay 100ms (When V<sub>CC</sub> is stable)
- 7. Send Display on command

4.2.2 Power down Sequence:

- 1. Send Display off command
- 2. Power down  $V_{CC}$
- 3. Delay 100ms (When  $V_{CC}$  is reach 0 and panel is completely discharges)
- 4. Power down  $V_{DD}$

Note :

- 1) Since an ESD protection circuit is connected between  $V_{\text{DD}}$  and  $V_{\text{CC}}$  inside the driver IC,
  - $V_{CC}$  becomes lower than  $V_{DD}$  whenever  $V_{DD}$  is ON and  $V_{CC}$  is OFF.
- 2)  $V_{CC}$  should be kept float (disable) when it is OFF.
- 3) Power Pins ( $V_{DD}$ ,  $V_{CC}$ ) can never be pulled to ground under any circumstance.
- 4)  $V_{\text{DD}}$  should not be power down before  $V_{\text{CC}}$  power down.

#### 4.3 Reset Circuit

Page 11 of 11

When RES# input is low, the chip is initialized with the following status:

- 1. Display off, Cursor off, Blink off.
- 2. Power Down off.
- 3. 5-dot font is default.
- 4. Display Shift Disable.
- 5. CGRAM address is 00h. SEGRAM address is 00h.
- 6. DDRAM address is 00h.
- 7. Display start line is set at display RAM address 0
- 8. Column address counter is set at 0
- 9. Normal scan direction of the COM outputs
- 10. Contrast control register is set at 7Fh
