| Lifetime |  | - | $\mathrm{Ta}=25^{\circ} \mathrm{C}, 50 \%$ checkerboard | 10,000 | - | - | Hrs |

Note: Lifetime at typical temperature is based on accelerated high-temperature operation. Lifetime is tested at average 50\% pixels on and is rated as Hours until Half-Brightness. The Display OFF command can be used to extend the lifetime of the display.
Luminance of active pixels will degrade faster than inactive pixels. Residual (burn-in) images may occur. To avoid this, every pixel should be illuminated uniformly.

## MPU Interface

For detailed timing information, see datasheet: http://www.newhavendisplay.com/app notes/SSD1322.pdf

## 6800-MPU Parallel Interface

The parallel interface consists of 8 bi-directional data pins, R/W, D/C, E, and /CS.
A LOW on R/W indicates write operation, and HIGH on R/W indicates read operation.
A LOW on D/C indicates "Command" read or write, and HIGH on D/C indicates "Data" read or write. The E input serves as data latch signal, while /CS is LOW. Data is latched at the falling edge of E signal.

| Function | E | R/W | /CS | D/C |
| :--- | :---: | :---: | :---: | :---: |
| Write Command | $\downarrow$ | 0 | 0 | 0 |
| Read Status | $\downarrow$ | 1 | 0 | 0 |
| Write Data | $\downarrow$ | 0 | 0 | 1 |
| Read Data | $\downarrow$ | 1 | 0 | 1 |

## 8080-MPU Parallel Interface

The parallel interface consists of 8 bi-directional data pins, /RD, /WR, D/C, and /CS.
A LOW on D/C indicates "Command" read or write, and HIGH on D/C indicates "Data" read or write. A rising edge of /RS input serves as a data read latch signal while /CS is LOW.
A rising edge of /WR input serves as a data/command write latch signal while /CS is LOW.

| Function | /RD | /WR | /CS | D/C |
| :--- | :---: | :---: | :---: | :---: |
| Write Command | 1 | $\uparrow$ | 0 | 0 |
| Read Status | $\uparrow$ | 1 | 0 | 0 |
| Write Data | 1 | $\uparrow$ | 0 | 1 |
| Read Data | $\uparrow$ | 1 | 0 | 1 |

Alternatively, /RD and /WR can be kept stable while /CS serves as the data/command latch signal.

| Function | /RD | /WR | /CS | D/C |
| :--- | :---: | :---: | :---: | :---: |
| Write Command | 1 | 0 | $\uparrow$ | 0 |
| Read Status | 0 | 1 | $\uparrow$ | 0 |
| Write Data | 1 | 0 | $\uparrow$ | 1 |
| Read Data | 0 | 1 | $\uparrow$ | 1 |

## Serial Interface (4-wire)

The 4-wire serial interface consists of serial clock SCLK, serial data SDIN, D/C, and /CS.
D0 acts as SCLK and D1 acts as SDIN. D2 should be left open. D3~D7, E, and R/W should be connected to GND.

| Function | /RD | /WR | /CS | D/C | D0 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Write Command | Tie LOW | Tie LOW | 0 | 0 | $\uparrow$ |
| Write Data | Tie LOW | Tie LOW | 0 | 1 | $\uparrow$ |

SDIN is shifted into an 8-bit shift register on every rising edge of SCLK in the order of D7, D6,...D0.
D/C is sampled on every eighth clock and the data byte in the shift register is written to the GDRAM or command register in the same clock.
Note: Read is not available in serial mode.

## Serial Interface (3-wire)

The 3-wire serial interface consists of serial clock SCLK, serial data SDIN, and /CS.
D0 acts as SCLK and D1 acts as SDIN. D2 should be left open. D3~D7, E, R/W, and D/C should be connected to GND.

| Function | /RD | /WR | /CS | D/C | D0 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Write Command | Tie LOW | Tie LOW | 0 | Tie LOW | $\uparrow$ |
| Write Data | Tie LOW | Tie LOW | 0 | Tie LOW | $\uparrow$ |

SDIN is shifted into an 9-bit shift register on every rising edge of SCLK in the order of D/C, D7, D6,...D0. $D / C$ (first bit of the sequential data) will determine if the following data byte is written to the Display Data RAM ( $D / C=1$ ) or the command register ( $D / C=0$ ).
Note: Read is not available in serial mode.
